

Table of Contents

Preface	v
Chapter 1 Introduction	1
Some introductory and motivational remarks. Dynamical variables and operator representatives. The probability operator and the Liouville equation (axiom no. one) and its physical significance (axiom no. two).	
Chapter 2 The Simple Shell Model	16
Reduction of the many-body problem to a collection of one-body problems. A spinless particle in an oscillator potential. Failure. A spin- $\frac{1}{2}$ particle with spin-orbit interaction — same potential. Considerable success in correlating measured nuclear spins. Some qualitative success with magnetic moments (not impressive). Failure with respect to electric quadrupole moments.	
Chapter 3 Introduction to Reaction Rates	37
The transition probability per unit time. Exact. First approximation. A scattering cross-section including the thermal average.	

Chapter 4	Neutron-Nuclear Cross-Sections	51
	The Boltzmann and the Maxwellian distributions for target initial states. A formula for a scattering cross-section assuming a Yukawa potential. Comparison with measured cross-sections. Generalization to include a spin-spin interaction. Compound-nuclear reactions. Resonance scattering, radiative capture, fission, etc. A higher (than the first) order approximation for the transition probability per unit time. A formula for a cross-section to describe compound nuclear processes. Cross-sections and density-density correlation functions ($S(\mathbf{Q}, \omega)$).	
Chapter 5	Some Applications	78
	Time-independent perturbation theory. Calculation of the specific heat of an Einstein crystal. Introduction to transport theory. Some discussions of allowed beta-decay. A formula for the electron energy spectrum in allowed beta-decay.	
Chapter 6	A Hamiltonian for Nonrelativistic, Spinless Charged Particles in the Presence of Electromagnetic Fields	92
	Quantization of the electromagnetic field. Creation and destruction operators. Recovery of Maxwell's equations.	
Chapter 7	A Relativistic Hamiltonian for the Description of the Interaction of Charged Particles with Electromagnetic Fields	95
	A few words about Compton scattering, photoelectric absorption, and pair production. The Dirac Hamiltonian. Calculation of the Klein-Nishina formula for a cross-section to describe Compton scattering. Eigenfunctions for the radiation field. Eigenfunctions for the free electron. Calculation of a cross-section to describe photoelectric absorption. Kinematics of pair production. Calculation of a cross-section to describe Cerenkov radiation. Some discussions of line widths seen in resonance reactions.	

Chapter 8	Some Interactions Experienced by Low Energy Photons	111
	Photon emission in atomic bound-bound transitions. Calculation of emission spectra-line widths here introduced phenomenologically. Absorption and the net emission rate. Lasing and a laser gain coefficient. The Nd-glass laser. More elaborate calculation of emission rates to incorporate level widths and shifts. Bremsstrahlung and inverse bremsstrahlung. Temperature dependence of the spontaneous emission spectrum. Plasma effects on light-plasma coupling by net inverse bremsstrahlung. Radiative electron-ion recombination. Cyclotron emission and absorption-calculation of reaction rates.	
Chapter 9	Light Scattering	135
	Calculation of a cross-section in terms of $S^E(\mathbf{Q}, \omega)$. Quantum effects on S^E for ideal gas. Discussion of S^E for real, but low density ($n^E \leq 10^{16} \text{ cm}^{-3}$), plasmas. Scattering by bound electrons. Mountain's formula for S for simple fluids.	
Chapter 10	Some Magnetic Interactions	149
Chapter 11	Miscellaneous Nonlinear Phenomena . . .	167
Subject Index	179
