

CONTENTS

PREFACE	v
Chapter 1. ELECTRONS AND PHONONS AND THEIR QUANTIZATION	1
1. Electron and Phonon Modes in Perfect Crystals	1
2. Many-body Description of One- and Two-body Forces	7
3. Second Quantization	11
4. Groundstate Energy in Hartree-Fock Approximation	19
Solutions to the Problems of Chapter 1	24
References to Chapter 1	29
Chapter 2. GREEN'S FUNCTION FORMALISM IN COMPLEX TIME	31
5. Schrödinger, Heisenberg and Interaction Representations	31
6. Evolution in Complex Time and Global Equilibrium Averages	35
7. Linear Response Functions and Green's Functions	41
8. Wick's Theorem for Operator Products	47
9. Wick's Theorem for Averages. Feynman Diagrams	51
10. Thermodynamic Feynman Diagrams	56
11. Dyson Equation, Selfenergy Diagrams and Dressed Propagators	64
12. Generating Functional for Feynman Diagrams. Ward Identities	74

Solutions to the Problems of Chapter 2	85
References to Chapter 2	94
Chapter 3. TRANSPORT PHENOMENA AND DISORDER EFFECTS	97
13. Boltzmann-equation Description of Electron Transport	98
14. Einstein Relation and Stationary Transport Coefficients	105
15. Residual Resistance and Dynamical Structure Factor	112
16. Resistivity Due to Electron-phonon Interaction. Semiconductors	121
17. Low-temperature Resistivity Due to Electron-electron Interaction	129
18. Kubo and Mori Formulas. Evaluation for Impurity Scattering	141
19. Disorder, Localization and Length Scaling	152
Solutions to the Problems of Chapter 3	165
References to Chapter 3	173
Chapter 4. SUPERCONDUCTIVITY	177
20. Effective Electron Attraction. Cooper Pairs and Schafroth Pairs	180
21. BCS Groundstate, Gap Equation and Bogoljubov Transformation	188
22. Binding Energy, Correlation Amplitudes and Coherence Length	195
23. Statistical Mechanics of Bogolons. The Transition Temperature	200
24. Thermodynamic Properties Near $T = T_c$ and Near $T = 0$	204
25. Weak Static Magnetic Field. London Equation and Critical Field	210
26. Weak Electromagnetic Field. Ginzburg-Landau Equation	218
27. Type-I and -II Superconductors. Flux Quantum, Critical Current	226
28. Strong-coupling Theory and Coulomb Repulsion	231
Solutions to the Problems of Chapter 4	242
References to Chapter 4	254

Chapter 5. MAGNETISM	257
29. Magnetism of Local Moments. Weiss' Molecular Field Theory	262
30. Groundstate and Magnons of the Heisenberg Model	271
31. The Static Magnetic Susceptibility of Band Electrons	281
32. Itinerant-electron Magnetism. Stoner's Molecular Field Theory	291
33. Groundstate, Excitations and Symmetries of the Hubbard Model	301
34. Weak Itinerant-electron Magnetism. Paramagnons	312
35. Itinerant-electron Ferromagnetism. Magnetization Fluctuations	328
36. Itinerant-electron Antiferromagnetism. Spin-density Waves.	344
Solutions to the Problems of Chapter 5	353
References to Chapter 5	368
AUTHOR INDEX	373
SUBJECT INDEX	385
