Preface	v
Chapter 1 Introduction	1
1.1 The task of statistical physics	1
1.2 On history of fundamentals of statistical thermodynamics	3
1.3 On history of the concept of Brownian motion	12
Chapter 2 Thermodynamic, Deterministic and Stochastic Levels of Description	19
2.1 Thermodynamic level: The fundamental laws	19
2.2 Lyapunov functions: Entropy and thermodynamic potentials	28
2.3 Energy, entropy, and work	32
2.4 Deterministic models on the mesoscopic level	39
2.5 Stochastic models on the mesoscopic level	49
Chapter 3 Reversibility and Irreversibility, Liouville and Markov Equations	57
3.1 Boltzmann's kinetic theory	57
3.2 Probability measures and ergodic theorems	64
3.3 Dynamics and probability for one-dimensional maps	69
3.4 Hamiltonian dynamics: The Liouville equation	73
3.5 Markov models	79
Chapter 4 Entropy and Equilibrium Distributions	83
4.1 The Boltzmann–Planck principle	83
4.2 Isolated systems: The microcanonical distribution	87
4.3 Gibbs distributions for closed and for open systems	89
4.4 The Gibbs–Jaynes maximum entropy principle	92

Chapter 5	Fluctuations and Linear Irreversible Processes	97
5.1	Einstein's theory of fluctuations	97
5.2	Fluctuations of many variables	100
5.3	Onsager's theory of linear relaxation processes	102
5.4	Correlations and spectra of stationary processes near equilibrium	105
5.5	Symmetry relations and generalizations	109
Chapter 6	Nonequilibrium Distribution Functions	111
6.1	A simple example — driven Brownian particles	111
6.2	Canonical-dissipative systems	115
6.3	Microcanonical non-equilibrium ensembles	118
6.4	Systems driven by energy depots	120
6.5	Systems of particles coupled to Nose–Hoover thermostats	126
6.6	Nonequilibrium distributions from information-theoretical methods	131
Chapter 7	Brownian Motion	139
7.1	Einstein's concept of Brownian motion	139
7.2	The Langevin equation: Theme and variations	141
7.2.1	The Langevin equation	141
7.2.2	Thermalization of the velocity: The fluctuation-dissipation theorem	142
7.2.3	The properties of the noise	144
7.3	Taylor–Kubo formula and velocity-velocity correlations	146
7.4	The overdamped limit	148
7.5	Example: The Ornstein–Uhlenbeck process	150
7.6	The path integral representation	153
7.7	A non-Markovian Langevin equation	155
Chapter 8	Fokker–Planck and Master Equations	161
8.1	Equations for the probability density	161
8.2	Special stochastic processes	165
8.2.1	Example 1: The Ornstein–Uhlenbeck process revisited	165
8.2.2	Example 2: The Klein–Kramers equation	167
8.3	The Fokker–Planck equation and the Liouville equation	169
8.4	Transition rates and master equations.	172
8.5	Energy diffusion and detailed balance	173
8.6	System in contact with several heat baths	176
Chapter 9	Escape and First Passage Problems	183
9.1	General considerations	183
9.2	The renewal approach.	185
9.3	Example: Free diffusion in presence of boundaries	188

9.4	Mean life time in a potential well	189
9.4.1	The flow-over-population approach	189
9.4.2	The Arrhenius law	191
9.4.3	Diffusion in a double-well	192
9.5	Moments of the first passage time	194
9.6	An underdamped situation	196
Chapter 10 Reaction Kinetics		199
10.1	The mass action law	199
10.2	Classical kinetics	202
10.3	The Smoluchowski approximation	203
10.4	Fluctuation effects in chemical kinetics	207
10.4.1	The Vaks–Balagurov kinetics in trapping	208
10.4.1.1	The Vaks–Balagurov problem in one dimension	209
10.4.1.2	General asymptotic behavior in trapping	212
10.4.2	Fluctuation-dominated kinetics in $A + B \rightarrow 0$ Reaction	215
10.4.3	Autocatalytic reactions and front propagation phenomena	221
Chapter 11 Random Walk Approaches		225
11.1	The random walk approach to transport processes.	226
11.1.1	Random walks on lattices	228
11.1.2	The continuous-time random walks (CTRW)	232
11.1.3	CTRW and the master equation	235
11.2	Power-law waiting-time distributions	236
11.3	Aging behavior of CTRW systems	241
11.4	CTRW and fractional Fokker–Planck equations.	245
11.5	Superdiffusion: Lévy flights and Lévy walks.	251
Chapter 12 Active Brownian Motion		261
12.1	The general model	261
12.1.1	Self-propelling of Brownian particles	261
12.1.2	Equations of motions	263
12.2	Force-free motion of active particles and mean square displacement	268
12.2.1	Distribution functions	268
12.2.2	Mean-square displacement	270
12.3	Deterministic motion in external potentials	273
12.3.1	Parabolic confinement	273
12.3.2	Perturbed and transient limit cycles	276
12.4	Stochastic motion in symmetric external potentials	279
12.5	Collective dynamics of clusters and swarms	285
12.5.1	Dynamics of active clusters and swarms	285
12.5.2	Confined systems of active particles	287
12.5.3	Dynamics of self-confined driven particles	292
12.5.4	The influence of hydrodynamic Oseen-type interactions	300
