Foreword	v
1 Introduction and motivation	1
1.1 Introduction	1
1.2 Short outline of the history of tribology	4
1.3 Leonardo da Vinci (1452–1519)	5
1.4 Guillaume Amontons (1663–1705)	6
1.5 Leonhard Euler (1707–1783)	7
1.6 Charles Augustin Coulomb (1736–1806)	9
1.7 Friction and wear	10
1.7.1 Ploughing	10
1.7.2 Wearless friction	10
1.8 Friction on a macroscopic scale	12
1.9 The Bowden and Tabor adhesion model	13
1.10 The shear strength	13
1.11 The real area of contact	14
1.11.1 Measuring the real contact area	15
<i>Optical methods</i>	15
<i>Resistance or conductance</i>	16
1.11.2 Single asperity contact	17
<i>Fully plastic contact: The plastic junction theory</i>	17
<i>Fully elastic: The Hertzian point contact</i>	18
<i>Including adhesive forces: The JKR model</i>	18
<i>Other approaches</i>	19
<i>Validity of the above model contacts:</i>	
<i>The Maugis Dugdale theory</i>	20
1.11.3 Statistical ensemble of asperities:	
Apparently flat surfaces	21
<i>The plastic contact</i>	21

	<i>The elastic contact</i>	21
	<i>The Greenwood and Williamson model (1966)</i> . . .	21
	<i>Experimental observations of height distributions</i> . .	24
2	Instruments	29
2.1	Introduction to instruments	29
2.2	Tribometer experiments	29
2.2.1	Plastic or elastic deformation	30
2.2.2	Velocity dependence	34
2.3	Extensions of tribometers	36
2.3.1	Electrical contact resistance	36
2.3.2	Height measurements	38
2.3.3	Wear measurements	38
2.3.4	Optical measurements	39
	<i>Micro-ellipsometry on the wear track</i>	39
	<i>Optical interferometry and spacer layer imaging method (SLIM)</i>	39
	<i>Nonlinear optical techniques</i>	40
2.3.5	Temperature measurements	43
2.3.6	Triboscopy	43
2.3.7	Implementation into ultrahigh vacuum	44
2.4	Surface force apparatus	44
2.4.1	Friction measurements with SFA	49
2.4.2	SFA-tribometry of ultrathin films	50
2.4.3	Adhesion vs. friction	50
2.5	Resonant stick-slip motion in colloidal crystals	55
2.6	Quartz crystal microbalance	57
2.7	Friction force microscopy	58
2.7.1	Introduction to friction force microscopy	58
2.7.2	Atomic-scale stick slip	62
2.7.3	Loading dependence	62
2.7.4	2d-histogram technique	67
2.7.5	Resolution limits	73
2.7.6	Stiffness measurements: Ways to determine the contact area in FFM	77
	<i>Normal contact stiffness measurements</i>	80
	<i>Lateral contact stiffness measurements</i>	81

2.8	Extensions of friction force microscopy: Nanosled experiments	85
2.8.1	Outlook	88
3	Normal forces at the atomic scale	99
3.1	Important forces between atoms and molecules	99
	<i>Ionic bonds</i>	99
	<i>Covalent bonds</i>	99
	<i>Metallic adhesive forces</i>	100
	<i>Van der Waals forces</i>	100
3.2	Important forces between probing tip and sample	101
3.2.1	Van der Waals forces	101
3.2.2	Magnetic forces	101
3.2.3	Electrostatic forces	102
3.2.4	Capillary forces	102
3.2.5	Short-range forces	103
3.3	Microscopic description of the tip-sample contact	105
3.3.1	Empirical potentials	105
3.3.2	Molecular dynamics	107
3.3.3	Continuum elasticity theory	111
3.3.4	Ab initio calculations	112
3.4	True atomic resolution with normal forces	115
4	Understanding of lateral forces	123
4.1	Geometrical effects: The role of topography	123
4.2	Step edges and Schwoebel barriers	124
4.3	Atomic-scale friction: Tomlinsons mechanism	136
4.3.1	Introduction	136
4.4	A modern analysis of Tomlinsons mechanism	140
4.4.1	One-dimensional Tomlinson model	141
4.4.2	Two-dimensional Tomlinson model	143
	<i>The critical curve</i>	146
4.4.3	Instabilities and the superlubric phase	147
4.5	Comparison of atomic-scale stick slip with the Tomlinson plucking mechanism	148
4.5.1	Atomic-scale stick slip under ultrahigh vacuum conditions	149
4.5.2	Zig-zag walk	153
4.6	Friction between atomically flat surfaces	155

4.6.1	Introduction	155
4.6.2	Commensurability in one dimension	156
4.6.3	The one-dimensional Frenkel-Kontorova-Tomlinson model	156
4.6.4	Two-dimensional infinite surfaces	157
4.6.5	Two-dimensional commensurate structures	157
4.6.6	The two-dimensional FKT model	160
4.6.7	Symmetry of the force scan image	161
4.6.8	Friction in the FKT model	162
	<i>Dependence on the pulling direction</i>	162
	<i>Dependence on the misfit angle</i>	162
	<i>Significance for the experiment</i>	163
	<i>Domains, slip lines and misfit centers</i>	163
4.6.9	Finite area of contact	165
4.7	Molecular dynamics simulations: Quantitative results	166
5	Dissipation mechanisms	175
5.1	Introduction	175
5.2	Friction behaviour in the limit $v \mapsto 0$	176
5.3	Phononic Friction	176
5.4	Electronic Friction	176
5.5	Van der Waals Friction	178
5.6	Comparison	179
6	Nanorheology and nanoconfinement	181
6.1	Introduction	181
6.2	Continuum mechanics	182
6.2.1	Elastic moduli and free energy relations	182
6.2.2	Special cases of elasticity and methods	185
6.2.3	Fundamental equations of fluid flow	187
6.2.4	Unsteady flow and viscous boundary layers	190
6.2.5	Hydrodynamic lubrication	192
6.2.6	Extended regimes of lubrication	196
6.2.7	Viscoelastic lubricants	199
6.2.8	Linear viscoelasticity of solids	200
6.2.9	Mechanical models	203
6.3	Nanorheological and shear behavior of confined liquids	205
6.3.1	Dynamic surface forces apparatus studies on confined liquids	206

6.3.2	Dynamic force microscopy study on liquids	214
6.3.3	Viscous friction force measurements between lubricated surfaces	217
6.3.4	Theoretical shear simulations and mechanical models	219
6.4	Nanorheological and shear behavior of complex liquids	221
6.4.1	Rheological and shear properties of confined complex liquids composed of polymer brushes and solvent . .	222
6.4.2	Rheological and shear properties of compressed polymer layers melts	224
6.4.3	Film thickness variations of compressed polymer layers under shear	228
6.4.4	Nanorheological properties of interfacially confined films	229
6.4.5	Lateral confinement of simple liquids	235
6.4.6	Measurements of interfacial and lateral confinement of low viscosity liquids	238
6.4.7	Dewetting-shear-apparatus	244
6.4.8	A list and summary of distinct confinements	245
6.5	Nanorheological and mechanical properties of polymeric surfaces and thin films measured by SFM	247
6.5.1	Introductory remarks	247
6.5.2	Static deformations and sinusoidal perturbations . .	248
6.5.3	Elastic indentation models of surfaces	252
6.5.4	Static force measurements on polymeric systems . .	253
6.5.5	Resolution limits of force modulation measurements	257
6.5.6	Procedure of scanning force modulation measurements	258
6.5.7	First promising measurement in force modulation .	260
6.5.8	Three-fold measurements: Topography, lateral force and force modulation	260
6.5.9	Determination of mechanical properties of polymer blends	261
6.5.10	Molecular mobility, interfaces and surface glass temperature	263
6.5.11	Measurement of shear moduli	265

6.5.12	Surface mechanical properties measured by lateral forces	265
6.5.13	Surface stresses as indicators of surface instabilities	266
6.5.14	Static and dynamic force-displacement measurements	268
6.5.15	Ultrasonic force method	270
6.5.16	Pulsed force method	271
6.5.17	Scanning static elastic method	271
6.5.18	Summarizing critical remarks	273
7	Generation of ultrasonic waves in sliding friction	287
7.1	Abstract	287
7.2	Introduction	287
7.3	The stick-slip process between flat surfaces with adsorbed soft molecules	289
7.4	Stick-slip processes between ideally flat surfaces without adsorbed soft molecules	291
7.5	Excitations of transverse acoustic vibrations in thin films by stick-slip processes	293
7.6	Excitation of ultrasonic waves by friction between rough surfaces <i>Theoretical considerations</i>	293
7.7	Previous experimental studies of acoustic emission	296
7.8	Proposed experiments for the detection of high frequency ultrasonic waves generated by friction	297
7.9	On the possible reduction of friction by ultrasonic waves	298
7.10	Conclusions	298
7.11	Acknowledgements	299
7.12	References	300
8	Friction force microscopy experiments	303
8.1	Material-specific contrast of friction force microscopy	303
8.1.1	Langmuir-Blodgett films	303
8.1.2	Anorganic thin films	306
8.1.3	Carbon surfaces	306
8.1.4	Silicon and silicon oxides	306
8.1.5	III-V Semiconductors	309
8.2	Anisotropy of friction	310
8.3	Role of environment	313

8.3.1	Humidity dependence: Mica	313
8.3.2	Humidity dependence: MoS ₂ -platelets on Mica and Al ₂ O ₃	314
8.4	Chemical nature of probing tip	319
8.4.1	Diamond on diamond	319
8.4.2	PTFE on silicon	319
8.4.3	SAM on SAM	320
8.4.4	Chemical force microscopy	324
8.5	Traditional and new concepts to understand the material-specific contrasts of FFM	326
9	Appendix: Instrumental aspects of force microscopy	337
9.1	Cantilevers	337
9.1.1	Design principles of cantilevers	338
	<i>Thermal vibrations</i>	338
	<i>Resonance frequency</i>	339
9.1.2	Minimum forces and Q-factor	339
9.1.3	Preparation of cantilevers	340
9.2	Microscopes	344
9.2.1	Deflection sensors: Techniques to measure small cantilever deflections	344
	<i>Electron tunneling</i>	344
	<i>Optical interference</i>	346
	<i>Laser beam deflection</i>	346
	<i>Capacitance</i>	347
	<i>Piezoresistivity and piezoelectricity</i>	347
9.3	Calibration procedures	348
9.3.1	Calibration of scanner	348
9.3.2	Calibration of lateral forces	349
9.4	Modes of operation	354
9.4.1	Imaging modes	354
9.4.2	Force vs. distance curves:	357
