Preface to the First Edition	ix
Preface to the Second Edition	xi
1 Computational Methods	1
1-1 Numerical calculations and beyond	1
1-2 Integers and floating numbers	5
1-3 Programming language and program library	7
1-4 Examples of algebraic, integer and floating number calculations	11
1-5 Examples of unconventional techniques	17
Problems	25
2 Integration and Differentiation	27
2-1 Numerical integration	27
2-2 Rectangular and trapezoidal rules	29
2-3 Simpson's rule	34
2-4 Gaussian quadrature	38
2-5 Monte Carlo integration	44
2-6 Multidimensional integrals and improper integrals	48
2-7 Numerical differentiation	56
Problems	60
3 Interpolation and Extrapolation	63
3-1 Polynomial interpolation	63
3-2 Interpolation using rational functions	70
3-3 Continued fraction	73
3-4 Fourier transform	76
3-5 Extrapolation	90
3-6 Inverse interpolation	97
3-7 Cubic spline	108
Problems	113

4	Special Functions	115
4-1	Hermite polynomials and harmonic oscillator	115
4-2	Legendre polynomials and spherical harmonics	120
4-3	Spherical Bessel functions	130
4-4	Laguerre polynomials	135
4-5	Error integrals and gamma functions	146
	Problems	152
5	Matrices	155
5-1	System of linear equations	155
5-2	Matrix inversion and <i>LU</i> -decomposition	164
5-3	Matrix approach to the eigenvalue problem	175
5-4	Tridiagonalization method	188
5-5	Eigenvalues and eigenvectors of a tridiagonal matrix	199
5-6	Lanczos method of constructing matrices	216
5-7	Nonsymmetric matrices and complex matrices	228
	Problems	235
6	Methods of Least Squares	237
6-1	Statistical description of data	237
6-2	Uncertainties and their propagation	247
6-3	The method of maximum likelihood	253
6-4	The method of least squares	257
6-5	Statistical tests of the results	263
6-6	Linear least-squares fit	272
6-7	Nonlinear least-squares fit to data	282
	Problems	292
7	Monte Carlo Calculations	295
7-1	Generation of random numbers	295
7-2	Molecular diffusion and Brownian motion	316
7-3	Data simulation and hypothesis testing	320
7-4	Percolation and critical phenomena	327
7-5	The Ising model	339
7-6	Path integrals in quantum mechanics	349
7-7	Fractals	363
	Problems	374
8	Finite Difference Solution of Differential Equations	377
8-1	Types of differential equations	377
8-2	Runge-Kutta methods	384
8-3	Solution of initial value problems by extrapolation	392
8-4	Boundary value problems by shooting methods	398

8-5	Relaxation methods	408
8-6	Boundary value problems in partial differential equations	417
8-7	Parabolic partial differential equations	422
8-8	Hyperbolic partial differential equations	432
8-9	Nonlinear differential equations	437
8-10	Stiffness problems	445
	Problems	449
9	Finite Element Solution to PDE	451
9-1	Background	451
9-2	Shape functions and finite element approximation	456
9-3	Assembling contributions from elements	461
9-4	Variational approach	464
9-5	Application to a two-dimensional Poisson equation	467
	Problems	476
Appendix A		477
A-1	Decomposition into prime numbers	477
A-2	Bit-reversed order	479
A-3	Gaussian elimination of a tridiagonal matrix	480
A-4	Random bit generator	482
A-5	Reduction of higher-order ODE to first-order	483
Appendix B	List of Fortran Program Examples	485
Bibliography		487
Index		493
