

CONTENTS

PREFACE	VII
INTRODUCTION	1
CHAPTER 1.	
PRINCIPLE OF REVERSIBILITY OF MODULATION-PARAMETRIC INTERACTIONS	21
1.1. Classification of oscillating systems, which give rise to forces seeking to change the effective reactive parameters and dissipation	21
1.2. Generalization of Manley–Row’s classical energy relations	23
1.3. Analytical techniques for investigating modulation-parametric phenomena in resonance systems with external pumping	30
1.4. Analytical techniques for investigating modulation-parametric phenomena in generator systems	34
CHAPTER 2.	
CONTROLLING EQUIVALENT IMPEDANCES OF RADIOPHYSICAL SYSTEMS	37
2.1. Methods of controlling the active and reactive parameters in modulation-parametric systems with external pumping	37
2.1.1. <i>Input conductance (impedance) of a cophasal parametric modulator</i>	38
2.1.2. <i>Input admittance (impedance) of a complex parametric modulator with „quadratic” pumping of the parametric elements</i>	41
2.1.3. <i>Experimental results concerning the input conductance of a cophasal parametric modulator</i>	42
2.1.4. <i>On the existence of a modulation-parametric channel of energy conversion and input in the course of different manipulations with signals</i>	45
2.2. Injection-locked oscillators as one-ports with controllable parameters	58
2.2.1. <i>A method for analyzing second order oscillating systems, close to the conservative ones, with strong reactive nonlinearity</i>	58

<i>2.2.2. Initial model and analytical techniques for investigating perturbed non-autonomous self-oscillating systems</i>	60
<i>2.2.3. Equivalent video-impedance of a one-port represented by an injection-locked oscillator</i>	64
<i>2.2.4. Analysis of the conversion properties of a one-port presented by a non-autonomous oscillator</i>	69
<i>2.2.5. Selective properties of an oscillator with asynchronous action</i>	75
2.3. Converting properties of receiving and transmitting SHF oscillator modules	78
<i>2.3.1. Short-range self-detecting Doppler radars (autodyne systems) described by differential equations of the second order</i>	78
<i>2.3.2. Short-range self-detecting Doppler radar systems described by differential equations of the third order</i>	88
2.4. Application of the principle of reversibility of the modulation-parametric interactions in radiophysical systems with external pumping	100
<i>2.4.1. Noise parameters and properties of one-ports with negative parameters built up on the basis of four-frequency parametric systems</i>	100
<i>2.4.2. Increasing the sensitivity of receiving systems of the type of a capacitive or inductive video sensor</i>	107
<i>2.4.3. Inductive sensor</i>	108
<i>2.4.4. Capacitive sensor</i>	111
<i>2.4.5. Implementation and utilization of modulation-parametric one-ports with negative conductance (negative resistance)</i>	118
<i>2.4.6. Implementation and utilization of modulation-parametric one-ports with negative capacitance</i>	120
<i>2.4.7. Implementation and utilization of modulation-parametric one-ports with negative inductance</i>	126
2.5. Application of self-oscillating one-ports with controllable parameters	129

CHAPTER 3.

NONLINEAR RESONANCE IN RADIOPHYSICAL SYSTEMS. IMPLEMENTATION OF PARAMETRIC ONE-PORTS. PECULIARITIES OF THE UTILIZATION OF SEMICONDUCTOR STRUCTURES IN RADIOPHYSICAL SYSTEMS	138
3.1. Nonlinear resonance in an oscillating circuit with a p-n junction of a semiconductor diode	138

3.1.1. <i>Effective (equivalent) parameters of the nonlinear oscillating circuit ...</i>	139
3.1.2. <i>The influence of higher harmonics on nonlinear resonance</i>	142
3.1.3. <i>Numerical analysis of the resonance properties of the oscillating circuit and experimental illustrations</i>	145
3.1.4. <i>Excitation of periodic oscillations on the basis of a nonlinear oscillating circuit with a pronounced hysteretic area on the resonance characteristic</i>	152
3.1.4.1. <i>An inductive case (asynchronous inductive motor)</i>	152
3.1.4.2. <i>A capacitive case (an asynchronous capacitive motor)</i>	162
3.2. Nonlinear and parametric resonance in a generalized oscillating circuit	165
3.2.1. <i>Equivalent circuit and approximation of the nonlinear characteristics .</i>	166
3.2.2. <i>Equations</i>	168
3.2.3. <i>Forced oscillations</i>	170
3.2.4. <i>Parametric resonance</i>	174
3.3. Generalized modified method of complex amplitudes for analyzing processes in nonlinear oscillating systems	177
3.4. Implementation of parametric one-ports	183
3.5. Influence of the effect of accumulation of a minority carrier charge on the performance of semiconductor diodes in radiophysical systems	194
3.5.1. <i>Phenomenological model of the process of charge accumulation</i>	195
3.5.2. <i>Frequency characteristics of detection</i>	199
3.5.3. <i>Diffusive impedance of the $p-n$ junction at high signal amplitudes and higher frequencies</i>	205
 CHAPTER 4.	
CHAOTIC OSCILLATIONS IN RADIOPHYSICAL SYSTEMS	211
4.1. Radiophysical systems with natural complex dynamics. Research methods	211
4.1.1. <i>Major concepts: bifurcations, chaos, strange attractor, fractal dimension. Conditions for the manifestation of chaotic behaviour in radiophysical systems</i>	211
4.1.2. <i>Basic mechanisms of transition from determined to chaotic oscillations</i>	216
4.1.3. <i>Methods and criteria for identifying chaotic oscillations</i>	218
4.1.4. <i>Experimental and numerical methods for investigating chaotic oscillations</i>	220
4.2. Chaotic oscillations in non-autonomous radiophysical systems with nonlinear reactance and parametric systems	225

4.3. Chaotic oscillations in generator radiophysical systems and SHF short-range self-detecting Doppler radars (autodyne systems) for close radiolocation	232
<i>4.3.1. Conditions for chaotization of the oscillations in generator systems</i> ...	232
<i>4.3.2. Bifurcations and chaos in autonomous and non-autonomous generator systems</i>	234
<i>4.3.3. Creating chaotic oscillations in generator systems with a delayed feedback</i>	238
<i>4.3.4. Chaos in SHF short-range self-detecting Doppler radars</i>	242

CHAPTER 5.

ELEMENTS OF RADIOPHYSICAL SYSTEMS	246
5.1. Generalization of the method of complex amplitudes for linear oscillating systems with periodic parameters and nonlinear systems	246
5.2. Linear periodic and almost periodic elements of radiophysical systems	247
<i>5.2.1. Periodic and almost periodic resistance and conductance</i>	247
<i>5.2.2. Periodic inductance and magnetic susceptibility</i>	254
<i>5.2.3. Periodic capacitance and electric elastance</i>	257
<i>5.2.4. Power consumed by periodic elements of the radio circuits</i>	258
5.3. Nonlinear elements of radiophysical systems	264
5.4. The law of energy conservation in oscillating systems	268

CHAPTER 6.

OSCILLATING CIRCUIT WITH CONSTANT PARAMETERS	272
6.1. Free and forced oscillations in a generalized oscillating circuit	272
6.2. Energy balance in a generalized oscillating circuit	278

CHAPTER 7.

GENERAL ANALYSIS OF THE PARAMETRIC PHENOMENA IN LINEAR OSCILLATING SYSTEMS WITH PARAMETERS CHANGING IN TIME	281
7.1. Qualitative analysis of the free processes in a generalized linear oscillating circuit with periodic parameters	281
<i>7.1.1. Structure of the differential equations describing linear oscillating systems with positive parameters</i>	282

7.1.2. *Vector differential equation describing a linear oscillating circuit with time-dependent parameters* 283

7.1.3. *Classification of the free processes in Hamiltonian oscillating circuits* . 289

7.1.4. *Phase plane of a linear oscillating circuit with periodic parameters* 297

7.1.5. *Stability of the canonical systems* 300

7.1.6. *Stability criteria of a generalized linear resonance circuit* 305

7.1.7. *Stability of an oscillating circuit with a piece-wise linear volt-coulomb characteristic* 311

7.1.8. *Analysis of the free processes in a linear quasi-harmonic oscillating circuit* 314

7.2. Stationary regime in linear radiophysical systems with periodic and almost periodic parameters 317

7.3. Parametric resonance in a linear oscillating circuit with periodic parameters 328

7.3.1. *Resonance 1. Geometric meaning of the resonance in a linear oscillating circuit with periodic parameters* 329

7.3.2. *Resonance 2. First and second power resonance of a linear oscillating circuit with periodic parameters* 336

7.3.3. *Resonance 3. Equation of the natural oscillations in the instability range* 340

CHAPTER 8.

NONLINEAR OSCILLATING SYSTEMS WITH PARAMETERS CHANGING IN TIME 348

8.1. **The principle of linear connection in the analysis of forced oscillations in a nonlinear oscillating circuit** 348

8.2. **„Strong” and „weak” resonance in a nonlinear system with explicitly time-dependent parameters** 357

8.3. **Quasi-periodic oscillations in an auto-generator with an oscillating circuit containing nonlinear reactance** 364

8.4. **Thermoparametric oscillations** 367

CHAPTER 9.

GROUPING OF COUPLED OSCILLATING SYSTEMS IN STABLE ELECTROMECHANICAL FORMATIONS 372

9.1. **Introduction** 372

9.2. Generalized conditions for grouping in stable electromechanical formations	374
9.3. Peculiarities of the processes of interaction between coupled oscillating systems	377
9.4. Electromagnetic tracking system	380
9.5. A tracing system with a self-tuning capacitance	382
<i>9.5.1. Conditions for grouping two oscillating systems with changing capacitive and constant ohmic coupling in stable formations</i>	382
<i>9.5.2. Ponderomotive forces and interaction energy in connected resonance systems with self-tuning capacitance</i>	384
9.6. Grouping of coupled dipole resonators under the action of an external electromagnetic wave	386

CHAPTER 10.

A PHENOMENON OF EXCITATION OF CONTINUOUS OSCILLATIONS WITH A DISCRETE SET OF STABLE AMPLITUDES ("QUANTIZED" OSCILLATION EXCITATION)	391
10.1. Introduction (Major model motions)	391
10.2. Numerical experiment of excitation of „quantized“ pendulum oscillations	398
10.3. Analytical proof of the existence of „quantized“ kick-pendulum oscillations	419
<i>10.3.1. An approach used in the case of small amplitudes of pendulum oscillation</i>	419
<i>10.3.2. Spectrum of the possible oscillation amplitudes of a pendulum under the action of an external nonhomogeneous force</i>	425
<i>10.3.3. Rotator under non-homogeneous action</i>	435
<i>10.3.4. General conditions for pendulum oscillation excitation under the action of an external nonlinear force</i>	439
<i>10.3.5. A proof of the existence of a modulation – parametric channel for energy input in the oscillation process</i>	445
<i>10.3.6. Excitation of continuous oscillations with a discrete set of stable amplitudes in a pseudo-linear oscillating system</i>	450
<i>10.3.7. Pendulum oscillations in case of oddness of the external exciting force</i>	461
<i>10.3.8. Approach in case of large amplitudes of pendulum oscillation</i>	464
10.4. „Quantization“ of the oscillations of an oscillator under the action of an incoming (falling) wave	472

10.4.1. *A model of the interaction of an oscillator with an electromagnetic wave: an approach in the case of small amplitudes of the oscillations in the system* . 472

10.4.2. *„Quantized“ cyclotron motion* 475

10.4.3. *The wave nature and dynamical quantization of the Solar System* 483

10.4.4. *Approach in the case of large amplitudes of the oscillations in a nonlinear dynamical system existing under wave action* 491

10.4.5. *General conditions for transition to irregular behavior in an oscillator under wave action* 494

10.5. Twist dissipative maps as a generalized model and immanent analyzing technique for the class of kick-excited self-adaptive dynamical systems 497

10.5.1. *Energy balance of the system* 497

10.5.2. *Construction of a discrete map* 498

10.5.3. *Fixed stationary map points* 500

10.5.4. *Stability of the stationary points. Conditions for bifurcation doubling of period* 502

10.5.5. *Generation of complex periodic solutions: multiplications in weakly dissipative maps* 504

10.5.6. *On the class of radial twist maps* 507

10.5.7. *Twist Maps and Hamiltonian Dynamics* 511

10.5.8. *Generalized Dissipative Twist Map of the Class of Kick-Excited Self-Adaptive Systems* 514

10.6. General Characteristics of the Class of Kick-Excited Self-Adaptive Dynamical Systems. Conclusions 517

CONCLUSION 524
