<b>FOREWORD</b>	<b>v</b>
<b>1. INTRODUCTION: A post-Duhemian thermodynamics</b>	<b>1</b>
<b>2. THERMOSTATICS AND THERMODYNAMICS</b>	<b>17</b>
2.1. Thermodynamic Systems	17
2.2. Thermodynamic States	23
2.3. Thermostatistics (Born–Caratheodory)	24
A. Axioms of Thermostatistics	24
B. Scaling of Temperature, Carnot’s Theorem	31
C. Thermodynamic Potentials	34
D. The Evolution of Real Systems; Continua	36
<b>3. VARIOUS THERMODYNAMICS</b>	<b>47</b>
3.1. Preliminary Remarks	47
3.2. Theory of Irreversible Processes (T.I.P.)	48
A. Axiom of Local State	48
B. Application to Deformable Material Continua	51
C. The Compressible Newtonian Fluid	53
D. The Linear Viscoelastic Solid	55
E. Finite-Strain Behavior of a Solid	57
F. Rubber-Like Materials	59
G. Anisotropic Elastic Materials	59
H. Onsager–Casimir Symmetry Relations	60
I. Dissipation Potential	62

3.3. Rational Thermodynamics	63
A. General Features	63
B. Thermoelastic Materials	65
C. Comparison with T.I.P.	71
D. Further Improvements	71
3.4. Extended Thermodynamics	72
3.5. Thermodynamics with Internal Variables	74
<b>4. THERMODYNAMICS WITH INTERNAL VARIABLES</b>	<b>77</b>
4.1. Nature and Choice of Internal Variables	77
4.2. Internal Variables and Functional Constitutive Equations	79
4.3. Non-Equilibrium and Equilibrium States	80
4.4. Accompanying Processes and States	83
A. Verbal Statement of the L.A.S.	84
B. Formal Statement of the L.A.S.	87
4.5. Applying T.I.P. to T.I.V.	89
4.6. Potentials of Dissipation	92
4.7. Internal Variables and Microstructure	95
A. Highly Heterogeneous Bodies	95
B. Internal Variables or Internal Degrees of Freedom?	97
4.8. Internal Variables and Phase Transitions	102
4.9. Comparison with Extended Thermodynamics	104
<b>5. APPLICATIONS: GENERAL FRAMEWORK</b>	<b>107</b>
5.1. Summary	107
5.2. Convexity of the Energy	110
5.3. General Properties of Dissipation Potentials	113
5.4. Convex Pseudo-Potential of Dissipation	114
5.5. Nonconvex Dissipation Potential	120
5.6. Reminder of Basic Equations	124
A. The Case Solids	124
B. The Case of Fluids	127
<b>6. VISCOSITY IN COMPLEX FLUIDS</b>	<b>129</b>
6.1. Introductory Remarks	129
6.2. The Notion of Simple (Non-Newtonian) Fluid	131
6.3. Statistical Theory of Polymeric Fluids	133
A. Molecular Models	133

B. Evolution Equation for the Conformation	137
C. Stress Tensor	138
6.4. Thermodynamics with Internal Variables	139
A. General View	139
B. The Internal Variable is an Anelastic Strain	142
C. The Internal Variable is a Conformation	144
D. The Internal Variable is a Vector	150
E. The Internal Variable is a Scalar	152
F. Forced Thermodynamic Systems	155
6.5. Diffusion and Migration	156
6.6. Vorticity and Conformation	158
6.7. Liquid Crystals	160
6.8. Structurally Complex Flows	163
6.9. Conclusions	164
<b>7. VISCOPLASTICITY AND PLASTICITY</b>	<b>167</b>
7.1. Introductory Remarks	167
7.2. Viscoelasticity of Solids	168
7.3. Plasticity and Viscoplasticity in Small Strains	173
7.4. Plasticity and Viscoplasticity in Finite Strains	180
7.5. Damage, Cyclic Plasticity and Creep	183
7.6. Relationship with Microscopic Theory	188
7.7. Remarks on Elastoplastic Composites	190
7.8. Remark on the Heat Equation	194
<b>8. THERMODYNAMICS OF FRACTURE</b>	<b>197</b>
8.1. Preliminary Remark	197
8.2. Energy Aspects of Brittle Fracture (no thermal fields)	199
8.3. On Account of Thermal Fields	204
8.4. Material Forces in Fracture	208
A. General Features	208
B. Evaluation of Elementary Dissipation	210
C. Global Balances of Momentum	212
D. Energy Argument	215
8.5. The Use of Generalized Functions in the Energy Equation	217
8.6. Remark on Cases Exhibiting Local Dissipation	220

<b>9. NON-EQUILIBRIUM THERMODYNAMICS OF ELECTROMAGNETIC MATERIALS</b>	<b>223</b>
9.1. General Remarks	223
9.2. Reminder on Electromagnetism	224
9.3. Thermomechanics of Electromagnetic Materials	229
9.4. Classical Irreversible Processes:	
Conduction and Relaxation	236
A. Rigid Bodies	236
B. Fluids	238
C. Deformable Solids	239
9.5. Thermodynamics with Internal Variables	242
A. Magnetic Solids in Small Strains	242
B. Electrically Polarized Solids in Finite Strains	245
9.6. Dielectric Relaxation in Ceramics	247
A. Delayed-Wave Analysis	250
B. Instantaneous Wave	251
9.7. Electro- and Magnetomechanical Hysteresis	253
A. Electric Bodies	253
B. Magnetic Bodies	259
C. Relation to Microscopic Descriptions	262
9.8. Elastic Superconductors	265
9.9. Solutions of Polyelectrolytes	271
A. Thermodynamical Modeling	271
B. Field Equations	272
C. Dissipative Processes	275
D. Mechano-Chemical Effect	278
E. Electrically Induced Conformational Phase Transition	279
F. Kerr Effect	279
9.10. Ferroelectrics and Ferromagnets	280
A. Deformable Ferromagnets	281
B. Elastic Ferroelectrics	285
9.11. Solutions of Magnetic Fluids	286
9.12. Electroelastic and Magnetoelastic Fracture	288
9.13. Concluding Remarks	292

<b>10. WAVES AND REACTION-DIFFUSION SYSTEMS (RDS)</b>	<b>295</b>
10.1. Preliminary Remarks	295
10.2. Simple RDS'	297
10.3. Models of Nerve-Pulse Dynamics: A Good Physical Example of Internal-Variable Theory	301
A. Nerve-Pulse Transmission	301
B. Thermodynamics of Nerve-Pulse Dynamics: FHN Model	305
C. Hodgkin–Huxley Model	308
D. More Complex Relaxation Equations	309
E. Some Conclusive Remarks	310
10.4. Coherent Phase-Transition Fronts: Another Example of Thermodynamics of Material Forces	311
A. The General Problem	311
B. Quasi-Static Progress of a Coherent Phase-Transition Front	313
C. Heat-Conducting Case	317
<b>BIBLIOGRAPHY</b>	<b>325</b>
<b>SUBJECT INDEX</b>	<b>359</b>
