CONTENTS	xxxii

PART I

A STORY OF RARE EVENTS :
FROM BARRIERS TO ELECTRONS TO UNKNOWN PATHWAYS

Chapter 1

Barrier crossings: classical theory of rare but important events 3

by David Chandler

1 – Introduction	7
2 – Cyclohexane isomerization	8
3 – High barriers, rare events	9
4 – Reaction coordinate, $q(t)$	12
5 – Rate constants and time correlation functions	13
6 – Reactive flux correlation function	14

7 – Choosing the transition state	16
8 – Lindemann-Hinshelwood and Kramers regimes	17
9 – Cyclohexane reactive flux	18
10 – Summary	21

Chapter 2

Electron transfer in water and other polar environments, how it happens	25
---	----

by David Chandler

1 – Marcus' scenario	29
2 – From the perspective of the electron	31
3 – From the perspective of the solvent nuclei	33
4 – Test of the Gaussian approximation	37
5 – Electron transfer rate constant	40
6 – Reorganization energy and the normal and inverted regimes	42
7 – Quantum mechanical electron transfer rate constant	43
8 – Surface hopping model and exponential decay	46
9 – Summary	48

Chapter 3

Finding transition pathways: throwing ropes over rough mountain passes, in the dark	51
---	----

by David Chandler

1 – Locating transition states	55
2 – Directed paths or chains of states	57
3 – Transition probabilities	59

4 – Illustrative examples	61
5 – Summary	65

PART II

THE ART OF SIMULATION

Chapter 4

Monte Carlo simulations	69
-------------------------	----

by Daan Frenkel

1 – Introduction	73
1.1 <i>Who should read this?</i>	73
1.2 <i>Monte Carlo simulations – why?</i>	73
2 – The Metropolis method	73
3 – Trial moves	75
3.1 <i>‘Unphysical’ moves</i>	76
3.2 <i>Composite moves</i>	76
4 – Cluster moves	80
4.1 <i>General cluster moves</i>	82
5 – Other ensembles	82
5.1 <i>Isobaric-isothermal ensemble</i>	83
5.2 <i>Grand canonical ensemble</i>	85
5.3 <i>Gibbs ensemble</i>	87
6 – Tracing coexistence curves	88
7 – Virtual moves	90
7.1 <i>Particle insertion method</i>	90
7.2 <i>Recursive sampling</i>	91
7.3 <i>Exact enumeration</i>	93

Chapter 5

Monte Carlo: changing the rules for fun and profit 97

by John Valleau

1	– Introduction	101
2	– Thermodynamic integration	104
3	– Histogram reweighting methods	105
4	– Umbrella sampling methods	109
4.1	<i>Introductory</i>	109
4.2	<i>Thermodynamic scaling</i>	111
4.2.1	One-dimensional thermodynamic scaling	115
4.2.2	Two dimensional scaling: an example	119
4.3	<i>Microscopic barriers</i>	124
5	– Conclusion	125

Chapter 6

Molecular dynamics methods for the enhanced sampling of phase space 127

by Bruce J. Berne

1	– Introduction	131
2	– Methods for dealing with the multiple time scale problem in Molecular Dynamics and path integrals	131
2.1	<i>Background</i>	132
2.2	<i>Integrators generated from factorizing the classical propagator</i>	133
2.3	<i>Reference system propagator algorithms</i>	135
2.3.1	Long and short range forces	135
2.3.2	Fast and slow processes	136
2.3.3	Combining force subdivision and dynamic subdivision	138
2.4	<i>The path-integral representation of quantum systems</i>	138
3	– New Monte Carlo methods	140
3.1	<i>Hybrid Monte Carlo</i>	141
3.2	<i>Jump walking</i>	142
3.3	<i>Smart walking</i>	144
3.4	<i>Generalized ergodic measures</i>	145

4	– Applications of MD based Monte Carlo schemes	146
4.1	<i>One dimensional random potential surface</i>	146
4.2	<i>Application to two protein systems</i>	150
5	– Summary	154

Chapter 7

	Constrained and nonequilibrium molecular dynamics	157
--	--	------------

by Giovanni Ciccotti and Mauro Ferrario

1	– Introduction	161
2	– Molecular dynamics with constraints	161
2.1	<i>The mechanical system with constraints</i>	162
2.2	<i>SHAKE optimization procedure and the numerical algorithm called SHAKE</i>	165
2.2.1	Optimization	165
2.2.2	The numerical algorithm SHAKE	165
2.3	<i>The statistical ensemble</i>	166
3	– Rare events via blue moon ensemble	169
3.1	<i>Computing reversible work by blue moon ensemble</i>	170
3.2	<i>Compute time correlation functions by blue moon ensemble</i>	173
4	– Non equilibrium molecular dynamics	174
5	– Concluding remarks	176

Chapter 8

	From Eyring to Kramers: computation of diffusive barrier crossing rates	179
--	--	------------

by Maria J. Ruiz-Montero

1	– Introduction	183
2	– Transition rate	183
3	– Statistical accuracy	185
4	– Square barrier	186

5 – General case	189
-------------------------	------------

Chapter 9

Monte Carlo methods for sampling of rare event states	195
--	------------

by Wolfhard Janke

1 – Introduction	199
-------------------------	------------

2 – Systems with rare event states	199
---	------------

3 – Multicanonical reweighting	201
---------------------------------------	------------

3.1 <i>Enhancing rare events</i>	201
--	-----

3.2 <i>Avoiding rare events</i>	203
---	-----

4 – Multicanonical multigrid algorithm	204
---	------------

4.1 <i>Multigrid techniques</i>	204
---	-----

4.2 <i>Multicanonical multigrid updates</i>	204
---	-----

4.3 <i>Results</i>	205
------------------------------	-----

5 – Multibondic algorithm	205
----------------------------------	------------

5.1 <i>Random cluster representation</i>	206
--	-----

5.2 <i>Multibondic reweighting</i>	206
--	-----

5.3 <i>Results</i>	207
------------------------------	-----

6 – Conclusions	208
------------------------	------------

Chapter 10

Transition-state theory investigations of small molecule diffusion in glassy polymers	211
--	------------

by Doros N. Theodorou

1 – Introduction	215
-------------------------	------------

2 – Diffusion as a sequence of elementary jumps	219
--	------------

3 – Molecular modeling of amorphous polymer glasses	221
--	------------

4	– TST in polymer matrices undergoing isotropic “elastic” motion: the Gusev-Suter approach	224
4.1	<i>The elastically moving matrix assumption</i>	224
4.2	<i>States and dividing surfaces</i>	225
4.3	<i>Calculation of the diffusivity</i>	227
5	– Multidimensional TST approach to gas diffusion in glassy polymers	227
5.1	<i>States, macrostates and reaction paths</i>	227
5.2	<i>Calculation of interstate transition rate constants</i>	236
5.3	<i>Coarse-graining to the macrostate level</i>	241
5.4	<i>Generation of a network of macrostates and estimation of the diffusivity</i>	242
6	– Conclusions and outlook	243
A	Multidimensional TST in generalized coordinates	246

Chapter 11

Some applications of the configurational-bias Monte Carlo technique 251

by Berend Smit

1	– Introduction	255
2	– Phase equilibria of n-alkanes	256
3	– Adsorption and diffusion of alkanes in zeolites	258
4	– Beyond chain molecules	262
4.1	<i>Mixtures of colloids and polymers</i>	262
4.2	<i>Parallel Monte Carlo simulations</i>	264
5	– Concluding remarks	264

Chapter 12

Elimination of fast variables via fictitious lattice particle dynamics 267

by Sauro Succi, Gino Bella, Hudong Chen, Chris Teixeira, and Kim Molvig

1	– Introduction	271
2	– Basics of digital physics	272

3	– Linearized collision operator	274
4	– Outline of the basic hydrodynamics derivations	275
5	– Reacting flows	278
6	– Discussion	280

Chapter 13

	Density functional techniques for simulation of chemical reactions	285
--	---	------------

by Michiel Sprik

1	– Introduction	289
2	– The Kohn-Sham exchange-correlation functional	290
	2.1 <i>Hohenberg-Kohn theorem</i>	290
	2.2 <i>Kohn-Sham equations</i>	292
3	– Separation of exchange and correlation	293
4	– The local density approximation	294
5	– Generalized gradient approximation	295
	5.1 <i>The exchange correlation hole</i>	295
	5.2 <i>Non-empirical GGA's</i>	297
	5.3 <i>Dynamical and non-dynamical correlation</i>	298
	5.4 <i>GGA's with adjustable parameters</i>	300
6	– Optimized effective potential	301
7	– Implications of exact exchange	303
	7.1 <i>Selfinteraction and electronic stability</i>	303
	7.2 <i>Exact exchange in atoms and solids</i>	304
8	– Hybrid methods	305

Chapter 14

	Path integral molecular dynamics: a computational approach to quantum statistical mechanics	311
--	--	------------

by Mark E. Tuckerman and Adam Hughes

1	– Introduction	315
2	– The density matrix and quantum statistical mechanics	316
3	– Path integrals in the canonical ensemble	319
3.1	<i>Derivation of the path integral</i>	319
3.2	<i>The path integral as a functional integral</i>	321
4	– Expectation values and thermodynamic properties derived from path integrals	322
5	– Molecular dynamics methods applied to path integrals	326
5.1	<i>Variable transformations</i>	326
5.2	<i>Diagonalizing the harmonic coupling</i>	328
5.3	<i>Ensuring ergodicity with thermostatted equations of motion</i>	331
5.4	<i>The equations of motion for path integral molecular dynamics</i>	333
5.5	<i>Integration methodology</i>	335
5.6	<i>Many-particle generalization</i>	336
5.7	<i>A convergence test</i>	337
6	– Path integral calculations in the NPT ensemble	338
6.1	<i>Equations of motion: primitive form</i>	340
6.2	<i>Equations of motion: Reduced form</i>	343
7	– Applications	344
7.1	<i>Charged water complexes and aqueous proton transfer</i>	344
7.2	<i>Hydrogen chloride trihydrate crystal</i>	348
7.3	<i>Fluid and solid para-Hydrogen</i>	349
8	– Conclusion	353
A	Derivation of the path integral virial theorem	354

Chapter 15

Proton transfer in ice	359
-------------------------------	------------

by Dominik Marx

1	– Proton transfer and phase transitions in ice	363
2	– <i>Ab initio</i> path integrals	367
2.1	<i>Basic ideas</i>	368
2.2	<i>Ergodicity, adiabaticity, and efficiency</i>	371
2.3	<i>Details of the ice simulations</i>	373

3	– Squeezing ice up to dissociation	374
3.1	<i>Changing structure with pressure</i>	374
3.2	<i>Where are the protons?</i>	376
3.3	<i>Free energy profiles</i>	378
4	– Concluding remarks	379

Chapter 16

Nudged elastic band method for finding minimum energy paths of transitions	385
---	------------

by Hannes Jónsson, Greg Mills, and Karsten W. Jacobsen

1	– Introduction	389
2	– Chain-of-states methods	391
3	– The NEB method	394
4	– Implementation of the NEB method	396
5	– Application to an adatom hop on a surface	397
6	– What happens if the springs are skipped?	399
7	– An object function for NEB	400
8	– Summary	402
A	The two-dimensional test problems	403
A.1	<i>Model I: LEPS potential</i>	403
A.2	<i>Model II: LEPS + Harmonic oscillator potential</i>	403

Chapter 17

RAW quantum transition state theory	405
--	------------

by Greg Mills, Greg K. Schenter, Dmitrii E. Makarov, and Hannes Jónsson

1	– Introduction	409
2	– Feynman path integrals	410

3	– How should a quantum transition state be defined?	410
4	– The action surface and the minimum action path	411
5	– The conical dividing surface of RAW-QTST	416
6	– The prefactor for RAW-QTST	418
7	– Application of RAW-QTST to a test problem	419

Chapter 18

Dynamics of peptide folding	423
------------------------------------	------------

by Ron Elber, Debasisa Mohanty, and Carlos Simmerling

1	– Introduction	427
2	– Kinetics of protein folding	427
2.1	<i>The two steps of protein folding</i>	427
2.2	<i>An ideally efficient folder</i>	428
2.3	<i>Difficulties in the design of fast folders</i>	430
3	– Folding of peptides	431
3.1	<i>Searching for peptides with a significant tendency to form a structure: methodology</i>	431
3.2	<i>A summary of the features of LES (Locally Enhanced Sampling)</i>	432
3.2.1	A qualitative discussion	432
3.2.2	A discussion with formulas	434
3.3	<i>Determination of peptide structure</i>	436
3.3.1	CA ₄ C	436
3.3.2	CHDLFC	437
3.4	<i>SYPFDV and variants</i>	438
4	– Final remarks	443

Chapter 19

Theoretical studies of activated processes in biological ion channels	445
--	------------

by Benoît Roux and Serge Crouzy

1	– Introduction	449
----------	-----------------------	------------

2	– Theoretical formulation	449
2.1	<i>Potential of mean force technique</i>	451
2.2	<i>Activated trajectory technique</i>	452
2.3	<i>High friction limit</i>	453
3	– Applications to biological systems	454
3.1	<i>Ion movement in the GA channel</i>	455
3.2	<i>Gating transition in a dioxolane-linked GA channel</i>	457
3.3	<i>Extension to quantum systems: centroid rate theory</i>	460
4	– Conclusions	460

Chapter 20

Ion channels: a challenge for computer simulations	463
---	------------

by Micheal L. Klein, Qingfeng Zhong, and Thomas Husslein

1	– Introduction	467
2	– Basic properties of ion channels	467
2.1	<i>Examples of ion channels</i>	468
2.2	<i>Structures of ion channels</i>	468
2.3	<i>Function of ion channels</i>	469
2.4	<i>Peculiarities of proton channels</i>	470
2.5	<i>Atomistic models of ion channels</i>	470
3	– Simulation studies of ion channels	471
3.1	<i>Molecular dynamics</i>	471
3.2	<i>Building blocks of a model ion channel</i>	472
3.2.1	Water	472
3.2.2	Lipids	472
3.2.3	Channel proteins	474
3.2.4	Protons	478
3.2.5	Membrane-bound ion channels	480
4	– Conclusions	483

PART III
QUANTUM DYNAMICS

Chapter 21

Mixed quantum-classical dynamics: mean-field and surface-hopping 489

by John C. Tully

1	– Introduction	493
2	– Ehrenfest (mean-field) approach	494
3	– Example: energy transfer at metal surfaces	500
4	– Surface-hopping	503
5	– Example: proton transfer in solution	509

Chapter 22

Non-adiabatic quantum dynamics simulation using classical baths 515

by Peter J. Rossky

1	– Introduction	519
2	– Mixed quantum-classical dynamical evolution	520
3	– Quantum decoherence and non-adiabatic dynamics	523
	3.1 Determination of the decoherence time	527
	3.2 Implementation in non-adiabatic simulation and application to the hydrated electron	532
4	– Conclusions	535

Chapter 23

**Thermal average time correlation functions from non-adiabatic MD:
application to rate constants for condensed phase non-adiabatic reac-
tions** **539**

by David F. Coker, Hsiao S. Mei, and Jean-Paul Ryckaert

1	– Introduction	543
2	– Theory	544
2.1	<i>Semiclassical evolution of wavefunctions</i>	544
2.2	<i>Thermally averaged time correlation functions for mixed quantum-classical systems</i>	550
3	– General implementation	558
3.1	<i>Initialization</i>	558
3.2	<i>Surface hopping methods to generate trajectories distributed according to $T_{ml}(\mathbf{R}(s)) ^2$</i>	559
4	– Electronically nonadiabatic barrier crossing rates	564
4.1	<i>The nonadiabatic reactive flux correlation function</i>	564
4.2	<i>Initial amplitude sampling in the transition state / nonadiabatic coupling region</i>	566
5	– Model Application	569
5.1	<i>Model system - bath problem and transition state theory results</i>	570
5.2	<i>General behavior of nonadiabatic reactive flux correlation functions, comparison with direct calculations</i>	573
5.3	<i>Effects of solvent friction on nonadiabatic transmission coefficient, comparison with adiabatic results and approximate theory</i>	577
6	– Conclusions	580

Chapter 24

Chemical rate laws and rate constants **583**

by Raymond Kapral, Styliani Consta, and Liam McWhirter

1	– Introduction	587
----------	-----------------------	------------

2	– Derivation of chemical rate laws	587
2.1	<i>Phenomenological description</i>	587
2.2	<i>Nonequilibrium initial ensemble</i>	589
2.3	<i>Rate law derivation</i>	590
2.4	<i>Structure of the rate kernel</i>	591
3	– Classical systems	593
3.1	<i>Diffusive barrier crossing: projected versus ordinary dynamics</i>	596
3.2	<i>Ion solvation dynamics in clusters</i>	599
4	– Mixed quantum-classical systems: adiabatic dynamics	602
4.1	<i>Proton transfer in molecular clusters</i>	605
5	– Mixed quantum-classical systems: nonadiabatic dynamics	609
5.1	<i>Nonadiabatic proton transfer</i>	612
6	– Conclusions	614

Chapter 25

The semiclassical initial value representation for including quantum effects in molecular dynamics simulations **617**

by William H. Miller

1	– Introduction	621
2	– The semiclassical initial value representation	622
3	– Electronically nonadiabatic processes	624
4	– Concluding remarks	626

Chapter 26

Tunneling in the condensed phase: barrier crossing and dynamical control **629**

by Nancy Makri

1	– Introduction	633
2	– Methodology	634

3	– Tunneling effects in barrier crossing	636
4	– Control of dissipative tunneling	640
5	– Conclusions and outlook	644

Chapter 27

Feynman path centroid methods for condensed phase quantum dynamics	647
---	------------

by Gregory A. Voth

1	– Introduction	651
2	– The centroid molecular dynamics method	652
2.1	<i>Theory</i>	652
2.2	<i>Algorithms for CMD</i>	653
2.2.1	MD-based methods	654
2.2.2	“Adiabatic” CMD	656
2.2.3	Path integral Monte Carlo approaches	657
2.2.4	Hyper-parallel implementation	657
3	– Representative applications of CMD	660
3.1	<i>Self-diffusion in liquid hydrogen</i>	660
3.2	<i>Quantum water simulations</i>	660
4	– A new perspective on centroid dynamics	660
4.1	<i>Centroid dynamics justified</i>	660
4.2	<i>Exact formalism for centroid dynamics</i>	664
4.3	<i>Approximate time evolution and the centroid molecular dynamics method</i>	665
5	– Concluding remarks	665

Chapter 28

Quantum molecular dynamics using Wigner representation	667
---	------------

by Vladimir S. Filinov, Sara Bonella, Yuri E. Lozovik, Alex V. Filinov, and Igor Zacharov

1	– Introduction	671
----------	-----------------------	------------

2	– Time dependent quantum averages	672
2.1	<i>Wigner's formalism</i>	672
2.2	<i>The evolution equation</i>	673
2.3	<i>The mean value as an average value</i>	675
2.3.1	Dynamics transfer	676
2.3.2	The stochastic process	677
2.3.3	The algorithm	681
3	– Quantum statistics: time dependent correlation functions	682
3.1	<i>The writing of a correlation function</i>	682
3.2	\bar{W}	686
3.3	<i>The average value</i>	688
4	– Problems	689
5	– Conclusions	690
A	Evolution equation for W	691

Chapter 29

Nonadiabatic molecular dynamics methods for diffusion	697
---	-----

by Daniel Laria, Giovanni Ciccotti, David F. Coker, Raymond Kapral, and Mauro Ferrario

1	– Introduction	701
2	– Semiclassical dynamics for mixed quantum-classical systems	701
2.1	<i>The Pechukas force</i>	702
2.2	<i>Quantum molecular dynamics algorithm</i>	703
3	– Quantum expression for the diffusion coefficient	706
4	– Molecular dynamics implementation	708
4.1	<i>Diagonalization of the Schrödinger Equation</i>	708
4.2	<i>Sampling procedure</i>	710
5	– An electron in a molten salt	711

Chapter 30

Modelling proton transfer in solution using non-additive valence-bond force fields 721

by Rodolphe Vuilleumier and Daniel Borgis

1	– Introduction	725
2	– Simple pictures for proton transfer in solution	726
2.1	<i>Relevant variables</i>	726
2.2	<i>Proton transfer along weak H bonds</i>	726
2.3	<i>Proton transfer along strong H bonds</i>	727
3	– EVB description of proton transfer	729
3.1	<i>Two-state model</i>	729
3.2	<i>Extended EVB model for proton transfer in water</i>	731
4	– Molecular dynamics at finite temperature	732
4.1	<i>Molecular dynamics algorithm</i>	732
4.2	<i>Simulated annealing for the $H^+(H_2O)_n$ clusters</i>	734
4.3	<i>Proton transfer in $H_5O_2^+$ and $H_{13}O_6^+$</i>	734
4.4	<i>Vibrational spectroscopy of the $H^+(H_2O)_n$ clusters</i>	736
4.5	<i>Simulation of an excess proton in liquid water</i>	737
5	– Quantum dynamics	738

Chapter 31

The quantum dynamics of interfacial hydrogen in metals: an introduction 743

by Jim D. Doll, Dongsup Kim, Maria Eleftheriou, Bin Chen, Chinsung Bae, and David L. Freeman

1	– Introduction	747
2	– Background	747
3	– Formal developments	750
4	– Applications	752
5	– Current and future research directions	756

Chapter 32

Modeling the solvent effect in electronic transitions 759

by Piero Procacci and Marc Souaille

1	– Introduction	763
2	– Semi-classical calculation of molecular absorption and fluorescence spectra	765
2.1	<i>Absorption</i>	765
2.2	<i>Fluorescence</i>	768
3	– Parameterization of the BO surfaces	770
3.1	<i>Electro-negativity equalization principle</i>	770
3.2	<i>Fitting the BO surfaces in polyatomic molecules</i>	773
4	– An application: the absorption and fluorescence spectrum of formaldehyde	775
5	– Conclusions and perspectives	778

Chapter 33

Migration of hydrogen on a solid surface: the physics of the process and the methodology 781

by Horia Metiu

1	– A physical description of the processes to be studied	785
2	– The correlation function theory	786
2.1	<i>The equations</i>	786
2.2	<i>The physical interpretation of the correlation function</i>	787
3	– The physics of atom migration on the surface	789
3.1	<i>The atom can be its own heat bath</i>	789
3.2	<i>Mean field theory, fluctuations, and dynamics</i>	793
3.3	<i>Why do we need simpler models?</i>	794
3.4	<i>How to define rate constants without including lattice dynamics?</i>	794
3.5	<i>How large are the errors of the simplified models?</i>	795
3.6	<i>Multiple jumps</i>	796
3.7	<i>Quantum systems</i>	799

Chapter 34

The rate of photon absorption

805

by Horia Metiu

1	– Introduction	809
2	– The system and the problem	809
2.1	<i>An electron in sodalite</i>	809
2.2	<i>The time-dependent method for calculating the absorption spectrum.</i>	809
2.3	<i>The QC version of the absorption cross section theory</i>	810
2.4	<i>Why should the QC method work?</i>	811
2.5	<i>Why the QC method shouldn't work</i>	812
2.6	<i>How bad is the QC method?</i>	814
2.7	<i>Why is the spectrum so hard to compute by a classical method?</i>	814
2.8	<i>A more detailed look at this interference</i>	815
2.9	<i>These comments are relevant to curve crossing also</i>	817
3	– How to compute the spectrum	817
3.1	<i>Introduction</i>	817
3.2	<i>The absorption cross-section revisited</i>	818
3.3	<i>We only need $C(t)$ for a short time</i>	818
3.4	<i>The implications of this finding</i>	819
3.5	<i>The gaussian wave packet (GWP) method</i>	820
3.6	<i>The adiabatic time-dependent Hartree method</i>	821
4	– Some results for an electron in zeolites	822
4.1	<i>The problem</i>	822
4.2	<i>Photon-induced migration</i>	823
4.3	<i>Spectra of complicated compounds are simple</i>	823
	AUTHOR INDEX	829
