

# Contents

<b>Preface</b>		<b>vii</b>
<b>I Introduction</b>		<b>1</b>
<b>Chapter 1 Beginnings</b>		<b>3</b>
1.1. Radiation Pressure Using Microwave Magnetrons . . . . .		3
1.2. Runners and Bouncers . . . . .		3
1.3. Back of the Envelope Calculation of Laser Radiation Pressure . . . . .		5
1.4. First Observation of Laser Radiation Pressure . . . . .		7
1.5. Observation of the First Three-Dimensional All-Optical Trap . . . . .		10
1.6. Scattering Force on Atoms . . . . .		11
1.7. Saturation of the Scattering Force on Atoms . . . . .		13
1.8. Gradient (Dipole) Force on Atoms . . . . .		13
1.9. Dispersive Properties of the Dipole Force on Atoms . . . . .		14
1.10. Applications of the Scattering Force . . . . .		16
1.11. “It’s not Even Wrong!” . . . . .		16
1.12. Optical Traps and the Prepared Mind . . . . .		19
<b>II 1969–1979</b>		<b>21</b>
<b>Chapter 2 Optical Levitation</b>		<b>23</b>
2.1. Levitation in Air . . . . .		23
2.2. Scientific American Article of 1973 . . . . .		27
2.3. Levitation with TEM <sub>01</sub> * Donut Mode Beams . . . . .		28
2.4. Levitation of Liquid Drops . . . . .		30
2.5. Radiometric or Thermal Forces . . . . .		31

2.6.	Levitation at Reduced Air Pressure . . . . .	34
2.7.	Feedback Damping of Levitated Particles and Automatic Force Measurement . . . . .	36
2.8.	Feedback Measurement of Axial Scattering Force . . . . .	37
2.9.	Feedback Force Measurement of High-Q Surface Wave Resonances . . . . .	38
2.10.	Measurement of Electric Forces by Feedback Control of Levitated Particles . . . . .	44
<b>Chapter 3 Atom Trapping and Manipulation by Radiation Pressure Forces</b>		<b>47</b>
3.1.	Early Concepts and Experiments with Atoms . . . . .	47
3.1.1.	Deflection of atoms by the scattering force . . . . .	47
3.1.2.	Doppler cooling of atoms using the scattering force and fluctuational heating of atoms . . . . .	47
3.1.3.	Damping of macroscopic particles . . . . .	50
3.1.4.	Saturation of the gradient force on atoms . . . . .	52
3.1.5.	Optimum potential $p$ for a given laser power . . . . .	55
3.1.6.	Conservative and nonconservative properties of the radiation pressure force components . . . . .	56
3.1.7.	Two-beam optical dipole traps for atoms . . . . .	58
3.1.8.	Single-beam optical dipole trap, or tweezer trap, for atoms . . . . .	59
3.1.9.	Separate trapping and cooling beams and the Stark shift problem . . . . .	61
3.1.10.	First demonstration of the dipole force on atoms using detuned light . . . . .	65
3.1.11.	Origin of atom optics . . . . .	67
3.2.	Theoretical Aspects of Optical Forces on Atoms . . . . .	68
3.2.1.	Quantum theory of “The motion of atoms in a radiation trap” . . . . .	68
3.2.2.	Optical Stark shifts and dipole force traps for atoms . . . . .	69
3.2.3.	Optical dipole forces . . . . .	70
3.2.4.	Conservation of momentum in light scattering by atoms and sub-micrometer particles . . . . .	70
<b>Chapter 4 Summary of the First Decade’s Work on Optical Trapping and Manipulation of Particles</b>		<b>75</b>
<b>III 1980–1990</b>		<b>77</b>
<b>Chapter 5 Trapping of Atoms and Biological Particles in the 1980–1990 Decade</b>		<b>79</b>
5.1.	Optical Trapping and Cooling of Neutral Atoms in the Decade 1980–1990 . . . . .	80
5.1.1.	Slowing of atomic beams by the scattering force . . . . .	81
5.1.2.	Scattering force traps and the optical Earnshaw theorem . . . . .	81
5.1.3.	Arrival of Steve Chu at the Holmdel Laboratory . . . . .	82
5.1.4.	Planning for the first atom trapping experiment . . . . .	83
5.1.5.	Stable alternating beam scattering force atom traps . . . . .	84
5.1.6.	First demonstration of optical molasses and early work on an optical trap . . . . .	86
5.1.7.	Cooling below the Doppler limit of molasses and below the recoil limit . . . . .	87

5.1.8.	Evaporative cooling from optical dipole traps . . . . .	88
5.1.9.	First atom trapping experiment using the single-beam dipole trap . . . . .	91
5.1.10.	Proposal for stable spontaneous force light traps . . . . .	93
5.1.11.	Nature's comments on the first atom trapping experiment . . . . .	94
5.1.12.	The first experimental demonstration of a MOT . . . . .	94
5.1.13.	Radiation trapping in MOTs . . . . .	95
5.1.14.	Atom cooling below the Doppler limit . . . . .	96
5.2.	Trapping of Biological Particles . . . . .	99
5.2.1.	Artificial nonlinear media . . . . .	101
5.2.2.	Trapping of submicrometer Rayleigh particles . . . . .	102
5.2.3.	Tweezer trapping of micrometer-sized dielectric spheres . . . . .	103
5.2.4.	Optical trapping and manipulation of viruses and bacteria . . . . .	105
5.2.5.	Optical alignment of tobacco mosaic viruses . . . . .	106
5.2.6.	Fixed particle arrays of tobacco mosaic viruses . . . . .	106
5.2.7.	Tweezer trapping of bacteria and "opticution" . . . . .	107
5.2.8.	Tweezer trapping of bacteria in a high-resolution microscope . . . . .	109
5.2.9.	Optical tweezers using infrared light from a Nd:YAG laser . . . . .	111
5.2.9.1.	Damage-free trapping of living cells . . . . .	111
5.2.9.2.	Internal cell trapping and manipulation . . . . .	113
5.2.9.3.	Separation of bacteria using tweezers . . . . .	114
5.2.9.4.	Elastic properties of the cytoplasm . . . . .	115
<b>IV</b>	<b>1990–2006</b>	<b>117</b>
<b>IVA</b>	<b>Biological Applications</b>	<b>123</b>
<b>Chapter 6</b>	<b>General Biological Applications</b>	<b>125</b>
6.1.	Application of Tweezers to the Study of Bacteria . . . . .	125
6.1.1.	Bacteria flagella and bacterial motors . . . . .	125
6.1.2.	Optical manipulation of extremophilia . . . . .	126
6.1.2.1.	Archaea . . . . .	126
6.1.2.2.	Sequencing of <i>Thermotoga maritima</i> , a eubacterium . . . . .	127
6.1.3.	Pilus retraction powers bacterial twitching motility . . . . .	128
6.1.4.	Direct observation of extension and retraction of type-IV pili . . . . .	128
6.1.5.	A force-dependent switch reverses type-IV pilus retraction . . . . .	129
6.1.6.	Characterization of photodamage to <i>Escherichia coli</i> in optical traps . . . . .	129
6.2.	Use of UV Cutting Plus Tweezers to Study Cell Fusion and Chromosomes . . . . .	130
6.3.	Tweezer Manipulation of Live Sperm and Application to <i>In Vitro</i> Fertilization . . . . .	130
6.4.	Tweezer Study of the Immune Response of T-Lymphocytes . . . . .	130
6.5.	Adhesion of Influenza Virus to Red Blood Cells Using OPTCOL Technique . . . . .	131

6.6.	Mechanical Properties of Membranes Studied by Tether Formation Using Tweezers . . . . .	131
6.7.	Deformation of Single Cells by Light Forces . . . . .	132
6.8.	Artificial Gravity in Plants . . . . .	134
6.9.	Guiding of Neuronal Growth with Light . . . . .	135
6.10.	Self-Rotation of Red Blood Cells in Optical Tweezers . . . . .	135
<b>Chapter 7 Use of Optical Tweezers to Study Single Motor Molecules</b>		<b>137</b>
7.1.	<i>In Vivo</i> Force Measurement of Dynein in Giant Amoeba <i>Reticulomyxa</i> . . . . .	138
7.2.	Measurement of the Force Produced by Kinesin . . . . .	140
7.3.	Resolution of the Stepping Motion of Kinesin on Microtubules by Interferometry . . . . .	140
7.4.	Observation of Single Stepwise Motion of Muscle Myosin-II Molecules on Actin Using Feedback and Tweezers . . . . .	143
7.5.	Measurement of Diffusional Motion and Stepping in Actin–Myosin Interactions . . . . .	145
7.6.	Measurement of Myosin Step Size Using an Oriented Single-Headed Molecule . . . . .	145
7.7.	Forces on Smooth Muscle Myosin and Use of Fluorescently Labeled ATP with Total Internal Reflection Microscopy . . . . .	145
7.8.	Observation of Two-Step Behavior of Myosin I Using the Tweezer Dumbbell Technique . . . . .	147
7.9.	Study of Processive Class-V Myosins Using a Pair of Tweezer Traps . . . . .	148
7.10.	Force vs. Velocity Measurement on Kinesin Motor Molecules . . . . .	148
7.11.	Single Enzyme Kinetics of Kinesin . . . . .	149
7.12.	Kinesin Hydrolyses One ATP Molecule per 8 nm Step . . . . .	149
7.13.	Feedback Control of Tweezers: Force Clamps and Position Clamps . . . . .	149
7.14.	Study of Single Kinesin Molecules with a Force Clamp . . . . .	150
7.15.	Structural Measurements on Kinesin . . . . .	152
7.16.	Substeps within the 8 nm Step of the ATPase Cycle of Single Kinesin Molecules . . . . .	153
7.17.	Processivity of a Single-Headed Kinesin Construct C351 and the Brownian Ratchet . . . . .	154
7.18.	Myosin VI is a Processive Motor with a Large Step Size . . . . .	156
7.19.	Mapping the Actin Filament with Myosin . . . . .	156
7.20.	Development Regulation of Vesicle Transport in <i>Drosophila</i> Embryos: Forces and Kinetics . . . . .	157
7.21.	Dynein-Mediated Cargo Transport <i>In Vivo</i> : A Switch Controls Travel Distance . . . . .	159
7.22.	Kinesin Moves by an Asymmetric Hand-Over-Hand Mechanism . . . . .	160
<b>Chapter 8 Applications to RNA and DNA</b>		<b>163</b>
8.1.	Observation of the Force of an RNA Polymerase Molecule as it Transcribes DNA . . . . .	163
8.2.	Force and Velocity Measured for Single Molecules of RNA Polymerase . . . . .	163
8.3.	Measurement of the Mechanical Properties of DNA Polymer Strands . . . . .	164
8.4.	Measurement of Flexural Rigidity of Microtubule Fibers and Torsional Rigidity of Microtubules and Actin Filaments . . . . .	165

8.5.	Measurement of the Stretching of Double- and Single-Stranded DNA . . . . .	165
8.6.	Polymerization of RecA Protein on Individual ds DNA Molecules . . . . .	166
8.7.	Study of Elasticity of RecA-DNA Filaments with Constant Tension Feedback . . . . .	166
8.8.	Possible Role of Tweezers in DNA Sequencing . . . . .	167
8.9.	Study of the Structure of DNA and Chromatin Fibers by Stretching with Light Forces . . . . .	168
8.10.	Condensation and Decondensation of the Same DNA Molecule by Protamine and Arginine Molecules . . . . .	170
8.11.	Non-Mendelian Inheritance of Chloroplast DNA in Living Algal Cells Using Tweezers . . . . .	170
8.12.	Measurement of the Force and Mechanical Properties of DNA Polymerase with Optical Tweezers . . . . .	171
8.13.	Reversible Unfolding of Single RNA Molecules by Mechanical Force . . . . .	172
8.14.	Grafting of Single DNA Molecules to AFM Cantilevers Using Optical Tweezers . . . . .	173
8.15.	Structural Transition and Elasticity from Torque Measurements on DNA . . . . .	174
8.16.	Backtracking by Single RNA Polymerase Molecules Observed at Near-Base-Pair Resolution . . . . .	175
8.17.	Ubiquitous Transcriptional Pausing is Independent of RNA Polymerase Backtracking . . . . .	176
8.18.	RNA Polymerase can Track a DNA Groove During Promoter Search . . . . .	177
8.19.	The Bacterial Condensin MukBEF Compacts DNA into a Repetitive, Stable Structure . . . . .	178
8.20.	Forward and Reverse Motion of RecBCD Molecules on DNA . . . . .	179
8.21.	Direct Observation of Base-Pair Stepping by RNA Polymerase . . . . .	179
<b>Chapter 9 Study of the Mechanical Properties of Other Macromolecules with Optical Tweezers</b>		<b>181</b>
9.1.	Stretching and Relaxation of the Giant Molecule Titin . . . . .	181
9.2.	Cell Motility of Adherent Cells Over an Extra-Cellular Matrix . . . . .	182
9.3.	Study of Forces that Regulate the Movement of Plasma Membrane Proteins . . . . .	184
9.4.	Membrane Tube Formation from Giant Vesicles by Dynamic Association of Motor Proteins . . . . .	187
<b>IVB Other Recent Applications in Physics and Chemistry</b>		<b>189</b>
<b>Chapter 10 Origin of Tweezer Forces on Macroscopic Particles Using Highly Focused Beams</b>		<b>191</b>
10.1.	Origin of the Net Backward Radiation Pressure Force in Tweezer Traps . . . . .	191
10.2.	Light Propagation at the Focus of a High Numerical Aperture Beam . . . . .	192
10.3.	Calculation of the Tweezer Forces on Dielectric Spheres in the Ray-Optics Regime . . . . .	193
10.4.	Corrections to Paraxial Ray Approximation for Strongly Focused Gaussian Beams . . . . .	194

10.5. Fifth-Order Corrected Electromagnetic Field Components for a Focused Fundamental Gaussian Beam . . . . .	194
10.6. Computation of Net Force and Torque for a Spherical Particle Illuminated by a Focused Laser Beam . . . . .	195
10.7. Measurements of the Forces on Microspheres Held by Optical Tweezers . . . . .	196
10.8. Generalized Lorenz–Mie Theory for Convergent Gaussian Beams . . . . .	196
10.9. Computation of Backward Radiation Pressure Using GLMT . . . . .	197
10.10. Single-Beam Trapping of Rayleigh and Macroscopic Particles Using Exact Diffraction Theory . . . . .	198
10.11. Optical Gradient Forces of Strongly Localized Fields . . . . .	199
10.12. Exact Theory of Optical Tweezers for Macroscopic Dielectric Spheres . . . . .	200
10.13. Use of Optical Tweezers as a Stylus Support for Scanning Force Microscopy . . . . .	201
10.14. Localized Dynamic Light Scattering . . . . .	202
10.15. Thermal Ratchet Motors . . . . .	202
10.16. Experimental Test of Kramers’ Theory of Thermally Driven Transition Rates . . . . .	203
<b>Chapter 11 Study of Charge-Stabilized Colloidal Suspensions</b>	<b>205</b>
11.1. Optically Induced Colloidal Crystals . . . . .	205
11.2. Optical Matter: Crystallization and Binding of Particles in Intense Laser Fields . . . . .	206
11.3. Microscopic Measurement of the Pair Interaction of Charge-Stabilized Colloids Using Tweezers . . . . .	207
11.4. Theoretical Approaches to the Understanding of Pair Interactions of Charge-Stabilized Colloids . . . . .	209
11.5. Confinement-Induced Colloidal Attractions in Equilibrium . . . . .	210
11.6. Entropic Forces in Binary Colloids . . . . .	211
11.7. Entropic Control of Particle Motion Using Passive Surface Microstructures . . . . .	212
11.8. Entropic Attraction and Repulsion in Binary Colloids Probed with a Line Optical Tweezer . . . . .	212
<b>Chapter 12 Rotation of Particles by Radiation Pressure</b>	<b>215</b>
12.1. Optically Induced Rotation of an Anisotropic Micro-Particle Fabricated by Surface Micromachining . . . . .	215
12.2. Optically Induced Rotation of a Trapped Micro-Object about an Axis Perpendicular to the Laser Beam Axis . . . . .	217
12.3. Optical Microrotors . . . . .	218
12.4. Orbital Angular Momentum . . . . .	218
12.5. Observation of Transfer of Angular Momentum to Absorptive Particles from a Laser Beam with a Phase Singularity . . . . .	221
12.6. Mechanical Equivalence of Spin and Orbital Angular Momentum of Light: An Optical Spanner . . . . .	222

12.7. Controlled Rotation of Optically Trapped Microscopic Particles . . . . .	223
12.8. Optical Torque Wrench: Angular Trapping, Rotation, and Torque Detection of Quartz Microparticles . . . . .	224
<b>Chapter 13 Microchemistry</b>	<b>225</b>
13.1. Laser Trapping, Electrochemistry, and Photochemistry of a Single Microdroplet . . .	227
13.2. Control of Dye Formation Inside a Single Laser-Positioned Droplet by Electrolysis . .	227
13.3. Laser-Controlled Phase Transitions in PNIPAM and Reversible Formation of Liquid Drops . . . . .	228
<b>Chapter 14 Holographic Optical Tweezers and Fluidic Sorting</b>	<b>231</b>
14.1. Nanofabrication with Holographic Tweezers . . . . .	231
14.2. Dynamic Holographic Tweezers . . . . .	231
14.3. Sorting by Periodic Potential Energy Landscapes: Optical Fractionation . . . . .	233
14.4. Optical Peristalsis . . . . .	234
14.5. Microfluidic Sorting in an Optical Lattice . . . . .	234
14.6. Microfluidic Control Using Colloidal Devices . . . . .	235
<b>IVC Applications of Atom Trapping and Cooling</b>	<b>237</b>
<b>Chapter 15 Uses of Slow Atoms</b>	<b>239</b>
15.1. Atomic Clocks Using Slow Atoms . . . . .	239
15.2. Atom Optics . . . . .	241
15.2.1. The first guiding and focusing of atoms using dipole forces . . . . .	241
15.2.2. Lenses based on the scattering force . . . . .	241
15.2.3. Magneto-optic waveguide and atomic beam brightness . . . . .	242
15.2.4. Evanescent wave mirrors . . . . .	245
15.2.5. Atomic beam splitters . . . . .	245
15.2.6. Neutral atom lithography . . . . .	245
15.2.7. Atom Interferometers . . . . .	245
15.3. Atomic Waveguide Devices . . . . .	246
15.3.1. Optical guiding of atoms . . . . .	246
15.3.2. Magnetic guiding of atoms near wires . . . . .	246
15.3.3. Magnetic guiding using atom chips . . . . .	247
15.3.4. Magnetic guiding around curves . . . . .	248
15.3.5. Magnetic guides as atomic beam splitters . . . . .	248
15.4. Cold Atom Collisions . . . . .	249
15.4.1. Photoassociation vs. associative ionization . . . . .	250
15.4.2. Dark spot MOTs . . . . .	252

15.4.3. Scanning photoassociative spectroscopy using far-off-resonance dipole traps . . . . .	252
15.4.4. Optical shielding or suppression of trap loss . . . . .	254
<b>IVD Bose–Einstein Condensation and Related Developments</b>	<b>257</b>
<b>Chapter 16 Introduction to Bose–Einstein Condensation</b>	<b>259</b>
16.1. First Demonstration of BEC, Using the TOP Magnetic Trap . . . . .	260
16.2. Bose–Einstein Condensation Using an Optically Plugged Magnetic Trap . . . . .	262
16.3. Bose–Einstein Condensation Using the “Cloverleaf” Magnetic Trap . . . . .	263
16.4. Bose–Einstein Condensation in $^7\text{Li}$ . . . . .	263
16.5. Expanding Bose–Einstein Condensates . . . . .	263
16.6. Gross-Pitaevskii Mean Field Theory . . . . .	264
16.7. Collective Excitation of a Bose–Einstein Condensate . . . . .	265
16.8. Coherence of Bose–Einstein Condensates . . . . .	265
16.8.1. Interference between two condensates . . . . .	265
16.8.2. Measurement of $\Delta p$ and the uncertainty principle . . . . .	267
16.8.3. Coherence and interference in the time domain . . . . .	267
16.8.4. Coherence of atoms tunneling out of arrays . . . . .	268
16.8.5. Spatial coherence of atoms ejected from a trap . . . . .	268
16.9. Condensate Formation by Bose Stimulation . . . . .	269
16.10. Atom Lasers . . . . .	269
16.10.1. Pulsed sodium atom laser . . . . .	270
16.10.2. cw atom laser . . . . .	270
16.10.3. Quasi-continuous atom laser by Raman ejection . . . . .	272
16.10.4. Coherent beams by Bragg scattering . . . . .	272
16.10.5. Coherent beam generation by four-wave mixing . . . . .	274
16.10.6. Commentary on Bose–Einstein condensates and nonlinear matter waves . . . . .	276
16.10.7. Two-component Bose–Einstein condensates in $^{87}\text{Rb}$ and sympathetic cooling . . . . .	277
16.10.8. Dynamics of two-component Bose–Einstein condensates in $^{87}\text{Rb}$ . . . . .	277
16.10.9. Phase memory in $^{87}\text{Rb}$ two-component Bose–Einstein condensates . . . . .	278
<b>Chapter 17 Role of All-Optical Traps and MOTs in Atomic Physics</b>	<b>279</b>
17.1. Far-Off-Resonance Optical Traps for $^{85}\text{Rb}$ . . . . .	280
17.2. Far-Off-Resonance Traps for Cesium Using $\text{CO}_2$ Lasers . . . . .	280
17.3. Evaporative Cooling of Sodium Atoms from an Optical Dipole Trap . . . . .	282
17.4. Raman Cooling of Trapped Atoms in a Dipole Trap . . . . .	282
17.5. Laser Noise Heating in Far-Off-Resonance Optical Dipole Traps . . . . .	282
17.6. Sisyphus Cooling of Cesium in Far-Off-Resonance Optical Dipole Traps . . . . .	283
17.7. Raman Cooling of Cesium in Far-Off-Resonance Optical Dipole Traps . . . . .	283
17.8. Two-Step Narrow-Line Cooling of Strontium in Optical Dipole Traps . . . . .	283

17.9. Continuous Doppler Cooling of Strontium Atoms in an Optical Dipole Trap . . . . .	285
17.10. Three-Dimensional (3D) Raman Sideband Cooling of Cesium in Optical Dipole Traps . . . . .	286
17.11. Blue-Detuned Optical Dark Traps for Achieving High Atomic Density . . . . .	287
17.12. Transfer of Bose–Einstein Condensates into Optical Dipole Traps . . . . .	288
<b>Chapter 18 Spinor Condensates in Optical Dipole Traps</b>	<b>291</b>
18.1. Dynamics of Formation . . . . .	291
18.2. Metastable Excited Spin States . . . . .	291
18.3. Optical Tunneling of Trapped Spinor States . . . . .	292
<b>Chapter 19 Feshbach Resonances</b>	<b>295</b>
19.1. Magnetic Tuning of the Scattering Length in a Dipole Trap . . . . .	295
19.2. Magnetic Tuning in Photoassociative Spectroscopy . . . . .	297
19.3. Feshbach Resonance of Ground State Cesium at Low Magnetic Field . . . . .	297
19.4. Elastic and Inelastic Collisions Near Feshbach Resonances in Sodium . . . . .	298
19.5. Suppression of Collision Loss in Cesium Near Feshbach Resonances . . . . .	299
19.6. Discovery of New Low-Field Feshbach Resonances by High-Resolution Spectroscopy . . . . .	299
19.7. Observation of Optically Induced Feshbach Resonances in Collisions of Cold Atoms . . . . .	301
<b>Chapter 20 Recent Work on Bose–Einstein Condensation</b>	<b>303</b>
20.1. Diffraction of a Released Bose–Einstein Condensate by a Pulsed Standing Light Wave . . . . .	303
20.2. Collective Collapse in a Bose–Einstein Condensate with Attractive Interactions . . . . .	305
20.3. <sup>85</sup> Rb Bose–Einstein Condensates with Magnetically Tunable Interactions . . . . .	305
20.4. Bose–Einstein Condensation in Metastable Helium Atoms . . . . .	306
20.5. Observation of Bose–Einstein Condensation Using Optical Dipole Traps . . . . .	307
20.6. Bose–Einstein Condensation of Potassium Atoms by Sympathetic Cooling . . . . .	309
20.7. Realization of Bose–Einstein Condensates in Lower Dimensions . . . . .	310
20.8. Josephson Junction Arrays with Bose–Einstein Condensates . . . . .	311
20.9. Josephson Effects in Dilute Bose–Einstein Condensates . . . . .	313
20.10. Squeezed States in a Bose–Einstein Condensate . . . . .	314
20.11. Quantum Phase Transition from a Superfluid to a Mott Insulator in a Gas of Ultracold Atoms . . . . .	315
20.12. Bose–Einstein Condensation on a Microelectronic Chip . . . . .	316
20.13. Bose–Einstein Condensates Near a Microfabricated Surface . . . . .	317
20.14. Tonks–Girardeau 1D Gas of Ultracold Atoms . . . . .	318
20.15. All-Optical Production of a Degenerate Fermi Gas . . . . .	319
20.16. Bose–Einstein Condensation of Cesium by Evaporative Cooling from Optical Dipole Traps . . . . .	319

20.17. Optimized Production of a Cesium Bose–Einstein Condensate . . . . .	320
20.18. Cooling Bose–Einstein Condensates Below 500 pK . . . . .	320
20.19. Design for an Optical cw Atom Laser . . . . .	320
<b>Chapter 21 Trapping Single Atoms with Single Photons in Cavity Quantum Electrodynamics</b>	<b>323</b>
21.1. The Simple One-Atom Maser . . . . .	324
21.2. The Two-Photon Maser . . . . .	324
21.3. Trapping Single Atoms in a MOT . . . . .	324
21.4. Coupling Single Atoms to a High-Finesse Optical Cavity . . . . .	325
21.5. Coupling of Single Slow Cesium Atoms to a High-Finesse Optical Cavity . . . . .	325
21.6. Cooling an Atom Strongly Coupled to a High- $Q$ Standing Wave Cavity . . . . .	325
21.7. Real-Time CQED and Atom Channeling with Single Atoms . . . . .	326
21.8. Formation of Giant Quasi-Bound Cold Diatoms by Strong Atom–Cavity Coupling . . . . .	326
21.9. Single Atoms Trapped in Orbit by Single Photons . . . . .	326
21.10. The Atom Cavity Microscope . . . . .	327
21.11. Dynamics of Single Atom Motion in the Field of a Single Photon . . . . .	328
21.12. Commentary on CQED in Nature’s “News and Views” . . . . .	329
21.13. Experimental Realization of a One-Atom Laser in the Regime of Strong Coupling . . . . .	329
21.14. Cavity Cooling of a Single Atom . . . . .	330
21.15. Deterministic Generation of Single Photons from One Atom Trapped in a Cavity . . . . .	330
<b>Chapter 22 Trapping of Single Atoms in an Off-Resonance Optical Dipole Trap</b>	<b>333</b>
22.1. Single Atoms in an Optical Dipole Trap: Towards a Deterministic Source of Cold Atoms . . . . .	333
22.2. Sub-Poissonian Loading of Single Atoms in a Microscopic Dipole Trap . . . . .	334
<b>Chapter 23 Vortices and Frictionless Flow in Bose–Einstein Condensates</b>	<b>337</b>
23.1. Vortices in a Two-Component Bose–Einstein Condensate . . . . .	337
23.2. Observation of Two-Component Vortices in a Bose–Einstein Condensate . . . . .	338
23.3. Single-Component Vortices in Bose–Einstein Condensates . . . . .	339
23.4. Single-Component Vortices Generated by an Optical Stirring Spoon . . . . .	339
23.5. Scissors Mode Excitation of Superfluidity . . . . .	340
23.6. Suppression and Enhancement of Impurity Scattering in a Bose–Einstein Condensate . . . . .	341
23.7. Hydrodynamic Flow in a Bose–Einstein Condensate Stirred by a Macroscopic Object . . . . .	344
23.8. Observation of Vortex Lattices in Bose–Einstein Condensates . . . . .	345
23.9. Measurement of the Angular Momentum of a Rotating Bose–Einstein Condensate . . . . .	346
23.10. Vortex Precession in Bose–Einstein Condensates: Observations with Filled and Empty Cores . . . . .	347
23.11. Generating Solitons by Phase Engineering of a Bose–Einstein Condensate . . . . .	348

<b>Chapter 24</b>	<b>Trapping and Manipulation of Small Molecules</b>	<b>351</b>
24.1.	Deflection of Neutral Molecules Using the Nonresonant Dipole Force . . . . .	352
24.2.	Observation of Optically Trapped Cold Cesium Molecules . . . . .	353
24.3.	Magnetic Trapping of Calcium Monohydride Molecules at mK Temperatures . . . . .	353
24.4.	Stimulated Raman Molecule Production in Bose–Einstein Condensates . . . . .	354
24.5.	Optical Centrifuge for Molecules . . . . .	354
24.6.	Cooling of Molecules by DC Electric Field Gradients . . . . .	355
24.7.	Cooling Molecules by Time-Varying Inhomogeneous Fields and Expansion from Nozzles . . . . .	357
24.8.	Electrostatic Trapping of Ammonia Molecules . . . . .	358
24.9.	Creation of Molecules from Atoms in a Bose–Einstein Condensate . . . . .	359
24.10.	Prospects for Trapping and Manipulating Ultracold Molecules . . . . .	359
24.11.	Dynamics of Coupled Atomic and Molecular Bose–Einstein Condensates . . . . .	360
<b>Chapter 25</b>	<b>Trapped Fermi Gases</b>	<b>363</b>
25.1.	Superfluid State of Atomic ${}^6\text{Li}$ in a Magnetic Trap . . . . .	363
25.2.	Elastic and Inelastic Collisions in ${}^6\text{Li}$ . . . . .	364
25.3.	Sympathetic Cooling of an Atomic Bose–Fermi Gas Mixture . . . . .	365
25.4.	Cooper Pair Formation in Trapped Atomic Fermi Gases . . . . .	366
25.5.	Collisional Relaxation in a Fermionic Gas . . . . .	366
25.6.	Observation of Fermi Degeneracy in Trapped ${}^{40}\text{K}$ Atomic Gas . . . . .	367
25.7.	Stable, Strongly Attractive Two-State Mixtures of ${}^6\text{Li}$ Fermions in an Optical Trap . .	368
25.8.	Observation of Fermi Pressure in a Doubly Degenerate Gas of Fermions and Bosons . . . . .	370
25.9.	Observation of a Strongly Interacting Degenerate Fermi Gas of Atoms . . . . .	371
25.10.	Emergence of a Molecular Bose–Einstein Condensate from a Fermi Gas . . . . .	371
25.11.	Observation of Resonance Condensation of Fermionic Atom Pairs . . . . .	372
25.12.	Evidence for Superfluidity in a Resonantly Interacting Fermi Gas . . . . .	373
25.13.	Collective Excitations of a Degenerate Gas at the BEC–BCS Crossover . . . . .	373
25.14.	Observation of the Pairing Gap in a Strongly Interacting Fermi Gas . . . . .	375
25.15.	Heat Capacity of a Strongly Interacting Fermi Gas . . . . .	376
25.16.	Commentary on the Search for Superfluidity in Fermi Gases . . . . .	377
25.17.	Vortices and Superfluidity in a Strongly Interacting Fermi Gas . . . . .	380
25.18.	Fermion Pairing in a Gas with Unequal Spin Populations . . . . .	380
<b>Afterword</b>		<b>383</b>
<b>Addendum A: Press Release: The 1997 Nobel Prize in Physics</b>		<b>391</b>
A.1.	Atoms Floating in Optical Molasses . . . . .	391
A.2.	Slowing Down Atoms with Photons . . . . .	392
A.3.	Doppler Cooling and Optical Molasses . . . . .	393

A.4. Doppler Limit Broken . . . . .	393
A.5. Recoil Limit also Broken . . . . .	394
A.6. Applications Just Round the Corner . . . . .	394
<b>Addendum B: Additional background material on the Nobel Prize in Physics 1997</b>	<b>397</b>
B.1. Historical Background . . . . .	398
B.2. Optical Molasses . . . . .	399
B.3. Sub-Doppler Cooling . . . . .	400
B.4. Sub-Recoil Cooling . . . . .	401
B.5. Applications . . . . .	402
<b>Addendum C: Uproar over Nobel Physics Prize</b>	<b>405</b>
