<i>Preface</i>	vii
1. Basic Concepts and Practice in Finance	3
1.1 Introducing mathematical finance . . . . .	3
1.2 Basic securities . . . . .	6
1.2.1 Stocks . . . . .	6
1.2.2 Bonds . . . . .	11
1.2.3 Others: bank accounts, currencies and commodities .	14
1.3 Derivative securities . . . . .	16
1.3.1 Options . . . . .	16
1.3.2 Other derivative securities . . . . .	23
1.4 Theory and practice . . . . .	26
2. Infinitesimal Analysis and Hypermodels	29
2.1 Motivations . . . . .	29
2.2 Hypermodels and analysis . . . . .	33
3. Absence of Arbitrage	39
3.1 Introduction . . . . .	39
3.2 Absence of arbitrage and the binary tree hypermodel . . . .	41
3.2.1 A mini-model . . . . .	41
3.2.2 Binary tree model . . . . .	44
3.2.3 Binary tree hypermodel . . . . .	46
3.2.4 Finiteness of stock prices . . . . .	52
3.2.5 Risk-neutral measure for binary tree hypermodel . .	55
3.3 Black-Scholes type PDE from virtually arbitrage-free . . . .	56
3.3.1 Virtually arbitrage free . . . . .	56

- 4. Explicit Option Pricing 59
  - 4.1 From hypermodel to PDE 59
    - 4.1.1 Barrier conditions for derivative claims 59
    - 4.1.2 Tangible price processes 62
    - 4.1.3 Differential equations in a hypermodel 65
    - 4.1.4 Black-Scholes type PDE 67
  - 4.2 Pricing options explicitly 69
    - 4.2.1 The classical Black-Scholes formula 69
  - 4.3 The barrier option 75
  - 4.4 The American option 82
  
- 5. Pricing with Binary Tree Hypermodels 85
  - 5.1 Hypermodels for the Cox-Ross-Rubinstein approach 85
  - 5.2 The CRR matrix and Examples 94
  
- 6. Further Applications 101
  - 6.1 Sensitivity analysis 101
    - 6.1.1 The Greeks 102
    - 6.1.2 Computing the Greeks from translating 106
  - 6.2 Implied volatility 114
  - 6.3 Term structure of interest rates 115
  
- 7. The Mathematics of Hypermodels 121
  - 7.1 Mathematical logic and Classical Hyperanalysis 124
    - 7.1.1 Logic and hypermodels  $^*\mathbb{R}$  124
    - 7.1.2 Construction of  $^*\mathbb{R}$  using the compactness theorem 131
    - 7.1.3 Construction of  $^*\mathbb{R}$  using ultrapowers 133
    - 7.1.4 Some basic properties of hypermodel  $^*\mathbb{R}$  135
    - 7.1.5 Hypermodels of  $\mathbb{R}$  in richer languages 137
    - 7.1.6 Some examples 139
    - 7.1.7 References 141
  - 7.2 The hyperuniverse 143
    - 7.2.1 Doing mathematics in the language of set theory 143
    - 7.2.2 Hyperuniverse and the hyperextension 146
    - 7.2.3 The existence of the hyperextension 156
    - 7.2.4 Applications and examples 159
    - 7.2.5 References 167
  - 7.3 Hyperanalysis of probability 167
    - 7.3.1 The Loeb measure construction 167
    - 7.3.2 Loeb integration theory 177

7.3.3	Some examples . . . . .	191
7.4	Hypermodels of Brownian Motion . . . . .	197
7.4.1	Anderson's discrete hypermodel of Brownian motion . . . . .	197
7.4.2	Some *continuous hypermodels of Brownian motion . . . . .	205
7.4.3	Some examples . . . . .	214
7.5	Itô Integral and Stochastic Differential Equations . . . . .	217
7.5.1	Some general remarks . . . . .	217
7.5.2	Wiener integral and Itô integral . . . . .	219
7.5.3	Itô's lemma and the Stratonovitch integral . . . . .	226
7.6	Solving Stochastic differential equations . . . . .	230
7.7	Malliavin calculus . . . . .	233
7.8	White noise analysis . . . . .	240
7.9	Universality and homogeneity properties of hyperfinite models . . . . .	254
Appendix A	<b>Mathematica</b> Programs . . . . .	257
A.1	Explicit formulas for pricing options . . . . .	258
A.1.1	Classical Black-Scholes formula . . . . .	258
A.1.2	Down-and-out European barrier option . . . . .	260
A.2	Implementation of the CRR matrix . . . . .	263
A.2.1	European options . . . . .	263
A.2.2	American put options . . . . .	266
A.2.3	Down-and-out European barrier call options . . . . .	268
A.2.4	Up-and-out European barrier call options . . . . .	270
A.2.5	European double barrier call options . . . . .	272
A.2.6	Digital options . . . . .	274
A.2.7	Extreme cases . . . . .	276
A.3	Other computations . . . . .	278
	<i>Bibliography</i> . . . . .	289
	<i>Index</i> . . . . .	295
