Preface	vii
Glossary of abbreviations	xix
Glossary of matrix notations	xxi
Chapter 1 Introduction	1
1.1 The linear model	1
1.2 Why a linear model?	3
1.3 Description of the linear model and notations	4
1.4 Scope of the linear model	6
1.5 Related models	9
1.6 Uses of the linear model	11
1.7 A tour through the rest of the book	13
1.8 Exercises	16
Chapter 2 Review of Linear Algebra	23
2.1 Matrices and vectors	23
2.2 Inverses and generalized inverses	28
2.3 Vector space and projection	31
2.4 Column space	36
2.5 Matrix decompositions	40
2.6 Löwner order	45
2.7 Solution of linear equations	47
2.8 Optimization of quadratic forms and functions	48

2.9 Exercises	52
Chapter 3 Review of Statistical Results	55
3.1 Covariance adjustment	55
3.2 Basic distributions	58
3.3 Distribution of quadratic forms	60
3.4 Regression	61
3.5 Basic concepts of inference	66
3.6 Point estimation	70
3.7 Bayesian estimation	78
3.8 Tests of hypotheses	82
3.9 Confidence region	85
3.10 Exercises	87
Chapter 4 Estimation in the Linear Model	93
4.1 Linear estimation: some basic facts	94
4.1.1 Linear unbiased estimator and linear zero function	94
4.1.2 Estimability and identifiability	97
4.2 Least squares estimation	100
4.3 Best linear unbiased estimation	102
4.4 Maximum likelihood estimation	107
4.5 Fitted value, residual and leverage	108
4.6 Dispersions	111
4.7 Estimation of error variance and canonical decompositions	113
4.7.1 A basis set of linear zero functions	113
4.7.2 A natural estimator of error variance	116
4.7.3 A decomposition of the sum of squares*	117
4.8 Reparametrization	118
4.9 Linear restrictions	120
4.10 Nuisance parameters	126
4.11 Information matrix and Cramer-Rao bound	128
4.11.1 The case of normal distribution*	128
4.11.2 The symmetric non-normal case*	131
4.12 Collinearity in the linear model*	134
4.13 Exercises	137

Chapter 5	Further Inference in the Linear Model	147
5.1	Distribution of the estimators	147
5.2	Confidence regions	148
5.2.1	Confidence interval for a single LPF	148
5.2.2	Confidence region for a vector LPF	150
5.2.3	Simultaneous confidence intervals*	151
5.2.4	Confidence band for regression surface*	156
5.3	Tests of linear hypotheses	158
5.3.1	Testability of linear hypotheses*	158
5.3.2	Hypotheses with a single degree of freedom	162
5.3.3	Decomposing the sum of squares	164
5.3.4	Generalized likelihood ratio test and ANOVA table	166
5.3.5	Special cases	168
5.3.6	Power of the generalized likelihood ratio test*	171
5.3.7	Multiple comparisons*	172
5.3.8	Nested hypotheses	173
5.4	Prediction in the linear model	174
5.4.1	Best linear unbiased predictor	175
5.4.2	Prediction interval	176
5.4.3	Simultaneous prediction intervals*	179
5.4.4	Tolerance interval*	179
5.5	Consequences of collinearity*	182
5.6	Exercises	185
Chapter 6	Analysis of Variance in Basic Designs	191
6.1	Optimal design	193
6.2	One-way classified data	194
6.2.1	The model	194
6.2.2	Estimation of model parameters	196
6.2.3	Analysis of variance	199
6.2.4	Multiple comparisons of group means	200
6.3	Two-way classified data	202
6.3.1	Single observation per cell	203
6.3.2	Interaction in two-way classified data	207
6.3.3	Multiple observations per cell: balanced data	212
6.3.4	Unbalanced data	216

6.4	Multiple treatment/block factors	219
6.5	Nested models	220
6.6	Analysis of covariance	224
6.6.1	The model	224
6.6.2	Uses of the model	224
6.6.3	Estimation of parameters	226
6.6.4	Tests of hypotheses	228
6.6.5	ANCOVA table and adjustment for covariate*	229
6.7	Exercises	232
Chapter 7 General Linear Model		243
7.1	Why study the singular model?	244
7.2	Special considerations with singular models	246
7.2.1	Checking for model consistency*	246
7.2.2	LUE, LZP, estimability and identifiability*	248
7.3	Best linear unbiased estimation	251
7.3.1	BLUE, fitted values and residuals	251
7.3.2	Dispersions	255
7.3.3	The nonsingular case	257
7.4	Estimation of error variance	258
7.5	Maximum likelihood estimation	261
7.6	Weighted least squares estimation	263
7.7	Some recipes for obtaining the BLUE	265
7.7.1	'Unified theory' of least squares estimation*	266
7.7.2	The inverse partitioned matrix approach*	268
7.7.3	A constrained least squares approach*	271
7.8	Information matrix and Cramer-Rao bound*	272
7.9	Effect of linear restrictions	275
7.9.1	Linear restrictions in the general linear model	275
7.9.2	Improved estimation through restrictions	278
7.9.3	Stochastic restrictions*	279
7.9.4	Inequality constraints*	282
7.10	Model with nuisance parameters	284
7.11	Tests of hypotheses	287
7.12	Confidence regions	290
7.13	Prediction	291

7.13.1	Best linear unbiased predictor	291
7.13.2	Prediction and tolerance intervals	293
7.13.3	Inference through finite population sampling*	294
7.14	Exercises	297

Chapter 8 Misspecified or Unknown Dispersion 305

8.1	Misspecified dispersion matrix	306
8.1.1	When dispersion misspecification can be tolerated*	308
8.1.2	Efficiency of least squares estimators*	315
8.1.3	Effect on the estimated variance of LSEs*	322
8.2	Unknown dispersion: the general case	324
8.2.1	An estimator based on prior information*	324
8.2.2	Maximum likelihood estimator	326
8.2.3	Translation invariance and REML	328
8.2.4	A two-stage estimator	330
8.3	Mixed effects and variance components	332
8.3.1	Identifiability and estimability	333
8.3.2	ML and REML methods	336
8.3.3	ANOVA methods	342
8.3.4	Minimum norm quadratic unbiased estimator	345
8.3.5	Best quadratic unbiased estimator	351
8.3.6	Further inference in the mixed model*	352
8.4	Other special cases with correlated error	353
8.4.1	Serially correlated observations	353
8.4.2	Models for spatial data	356
8.5	Special cases with uncorrelated error	358
8.5.1	Combining experiments: meta-analysis	358
8.5.2	Systematic heteroscedasticity	361
8.6	Some problems of signal processing	362
8.7	Exercises	364

Chapter 9 Updates in the General Linear Model 371

9.1	Inclusion of observations	372
9.1.1	A simple case	372
9.1.2	General case: linear zero functions gained*	375
9.1.3	General case: update equations*	378

9.1.4	Application to model diagnostics	383
9.1.5	Design augmentation*	385
9.1.6	Recursive prediction and Kalman filter*	389
9.2	Exclusion of observations	397
9.2.1	A simple case	398
9.2.2	General case: linear zero functions lost*	400
9.2.3	General case: update equations*	402
9.2.4	Deletion diagnostics	404
9.2.5	Missing plot substitution*	407
9.3	Exclusion of explanatory variables	410
9.3.1	A simple case	412
9.3.2	General case: linear zero functions gained*	413
9.3.3	General case: update equations*	415
9.3.4	Consequences of omitted variables	417
9.3.5	Sequential linear restrictions*	417
9.4	Inclusion of explanatory variables	417
9.4.1	A simple case	418
9.4.2	General case: linear zero functions lost*	419
9.4.3	General case: update equations*	421
9.4.4	Application to regression model building	422
9.5	Data exclusion and variable inclusion*	423
9.6	Exercises	424
Chapter 10 Multivariate Linear Model		429
10.1	Description of the multivariate linear model	430
10.2	Best linear unbiased estimation	431
10.3	Unbiased estimation of error dispersion	435
10.4	Maximum likelihood estimation	439
10.4.1	Estimator of mean	439
10.4.2	Estimator of error dispersion	440
10.4.3	REML estimator of error dispersion	441
10.5	Effect of linear restrictions	442
10.5.1	Effect on estimable LPFs, LZFs and BLUEs	442
10.5.2	Change in error sum of squares and products	443
10.5.3	Change in 'BLUE' and mean squared error matrix	444
10.6	Tests of linear hypotheses	445

10.6.1	Generalized likelihood ratio test	445
10.6.2	Roy's union-intersection test	448
10.6.3	Other tests	449
10.6.4	A more general hypothesis	453
10.6.5	Multiple comparisons	454
10.6.6	Test for additional information	455
10.7	Linear prediction and confidence regions	457
10.8	Applications	460
10.8.1	One-sample problem	460
10.8.2	Two-sample problem	460
10.8.3	Multivariate ANOVA	461
10.8.4	Growth models	462
10.9	Exercises	463
 Chapter 11 Linear Inference — Other Perspectives		 469
11.1	Foundations of linear inference	470
11.1.1	General theory	470
11.1.2	Basis set of BLUEs	476
11.1.3	A decomposition of the response	479
11.1.4	Estimation and error spaces	483
11.2	Admissible, Bayes and minimax linear estimators	486
11.2.1	Admissible linear estimator	486
11.2.2	Bayes linear estimator	489
11.2.3	Minimax linear estimator	492
11.3	Biased estimators with smaller dispersion	500
11.3.1	Subset estimator	500
11.3.2	Principal components estimator	503
11.3.3	Ridge estimator	506
11.3.4	Shrinkage estimator	508
11.4	Other linear estimators	510
11.4.1	Best linear minimum bias estimator	510
11.4.2	'Consistent' estimator	512
11.5	A geometric view of BLUE in the Linear Model	512
11.5.1	The homoscedastic case	513
11.5.2	The effect of linear restrictions	515
11.5.3	The general linear model	516

11.6 Large sample properties of estimators	521
11.7 Exercises	525
Solutions to Odd-Numbered Exercises	533
Bibliography and Author Index	587
Index	607
