Foreword by Benoit Mandelbrot	xvii
Preface	xxv
Prologue	xxix
PART I THE SCIENCE OF COSMIC ORDER	1
Chapter 1 The birth of cosmological principles	3
1.1 The seeds were sown – the myth explains the world	3
1.2 Celestial writing on the Babylonian sky	5
1.3 The Ionian Revolution	6
1.4 Anaximander solves the paradox of unfalling Earth	7
1.5 The sky becomes a sphere	8
1.6 Atomists see a glimpse of the microcosm	9
1.7 Plato’s mathematical heaven	10
1.8 Aristotle’s scientific method	12
1.9 The principle of circular motion	13
1.10 But what is actually rotating?	15
1.11 Towards the principle of no center	16
1.12 The Wisdom of Antiquity was kept alive	16
1.13 The world edifice of the Middle Ages	18
Chapter 2 The gate into cosmic order	21
2.1 Roots of De Revolutionibus	21

2.2	New understanding on matters celestial	22
2.3	The young Rheticus visits the old Copernicus	24
2.4	Bruno breaks the stellar sphere	25
2.5	. . . and Galileo opens the gate	27
2.6	The blurred new view through the magnifying tube	28
2.7	Kepler's laws of cosmic order	29
2.8	Nicholas of Cusa: the center is everywhere	30
2.9	Digges, Bruno, and the Copernican Principle	31
2.10	The first steps on the cosmic distance ladder	34
2.11	Stars are remote suns	35
2.12	Understanding the new cosmic order	37
2.13	The triumph of Newton's universal gravity	39
2.14	Just add one particle more...	40
Chapter 3 The Paradoxal Universe of Sir Isaac		41
3.1	Structure of the Heavens	41
3.2	Newton's Cosmology in a Nutshell	43
3.3	Cosmological paradox	43
3.4	Why do we not feel an infinite gravity force?	44
3.5	How to tame the infinite gravity?	45
3.6	If, however, a uniform infinite cloud of stars exists, why has it not collapsed?	47
3.7	Why is the night sky so dark?	48
3.8	The riddle of the shining stars	50
3.9	What has saved us from the ultimate heat death?	51
Chapter 4 The dream of a hierarchical world: protofractals		53
4.1	Stars and nebulae	53
4.2	Emanuel Swedenborg	54
4.3	Cartesian physics	56
4.4	The Swedenborg self-similar universe	57
4.5	Towards the origin of the Solar System	59
4.6	Hierarchies of Kant and Lambert	60
4.7	Finite or infinite?	62
4.8	Emerging protofractals	63
4.9	Inwards and outwards	65

PART II COSMOLOGICAL PHYSICS FOR THE REALM OF GALAXIES 67

Chapter 5	The new world of relativity and quantum forces	69
5.1	The Principle of Relativity	69
5.2	The relativistic physics of Poincaré and Einstein	70
5.3	Velocity of light	72
5.4	From classical space and time...	73
5.5	... to relativistic space-time	74
5.6	Time travel into the future with a one-way ticket	75
5.7	Rest mass energy: $E = mc^2$	75
5.8	Light, electricity, and magnetism	76
5.9	Least action, symmetry, conservation laws	77
5.10	Quantum physics of the microworld	78
5.11	Heisenberg's Uncertainty Principle: nebulous particle	79
5.12	The search for genuine atoms	80
5.13	Quarks hide inside protons	83
5.14	The quantum nature of fundamental forces	84
5.15	"Fur coat" of virtual particles and the boiling vacuum	85
5.16	Spiraling down into the microcosm?	87
5.17	From terrestrial to cosmic laboratory	88
Chapter 6	Gravity – the enigmatic creator of order	89
6.1	The nature of gravity	89
6.2	Newton's law and the gravitational constant	90
6.3	The riddle of inertial and gravitating masses	91
6.4	Relativistic gravity emerges in our Solar System	92
6.5	Geometry of curved spaces	93
6.6	General relativity as geometrical gravity theory	95
6.7	What causes gravity according to general relativity?	97
6.8	Big Bang, Black Hole, Time Machine...	98
6.9	... but riddles still exist	99
6.10	Feynman's quantum field approach to gravity	100
6.11	Relativistic effects in quantum field gravity	102
6.12	Gravity as a builder of celestial structures	103
6.13	Energy flows and order from chaos	104
6.14	A star is a self-gravitating nuclear reactor	105
6.15	Exploding stars – the end of the fight?	106

Chapter 7	The law of redshift in the kingdom of galaxies	109
7.1	The Island Universes	109
7.2	The distance to the “Little Cloud” is measured	111
7.3	Pulsating stars light up the way to Andromeda	111
7.4	The diversity of galactic geometries	112
7.5	Our home galaxy – the Milky Way	114
7.6	Spectra – fingerprints of stellar matter	115
7.7	Spectral line shift – a celestial message	116
7.8	Discovery of extragalactic redshifts	117
7.9	The search for a relation between redshift and distance	118
7.10	The law of redshifts: a new cosmic phenomenon	119
7.11	Galaxies live in swarms	121
7.12	Super energies in the galaxy universe	122
7.13	Anomalous redshifts – the exception to the rule?	125
7.14	Redshift quantization?	126
Chapter 8	The triumph of uniformity in cosmology	129
8.1	Friedmann’s discovery of expanding universes	129
8.2	Cosmological redshift in expanding space	132
8.3	Uniformity gives rise to the Hubble law	133
8.4	The Hubble constant measures the age of the universe	134
8.5	The oldest stars – almost as ancient as the universe	135
8.6	The geometries of Friedmann’s world models	137
8.7	The cosmic density of matter in the universe	138
8.8	George Gamow’s hot beginning	139
8.9	Discovery of the cosmic thermal radiation	140
8.10	The 3 Kelvin glow – the cool relic of the hot bang	141
8.11	Cooking the light elements	142
8.12	After solving Newton’s paradoxes of infinity	143
8.13	... new enigmas of Friedmann’s uniform world appear	143
8.14	Inflation comes and resolves the paradoxes	144
8.15	The age of the inflationary universe	145
8.16	When were the galaxies and their clusters born?	146
8.17	The big bang triumph – its logic and components	147

PART III THE ELUSIVE SIMPLICITY OF UNIFORM SPACE AND MATTER 149

Chapter 9	The mysterious singularity	151
9.1	A uniform matter distribution leads to a singularity	151
9.2	What is a black hole singularity?	152
9.3	Einstein objects to the physical reality of the singularity . . .	153
9.4	Are there alternatives to singularity?	155
9.5	Gravastars, eternally collapsing objects, dark stars...	156
9.6	Relativistic astrophysics probes strong gravity	157
9.7	A binary pulsar – an ideal gravity laboratory	158
9.8	The search for gravity waves from collapsing stars	159
9.9	Two closest supernovae – signs of gravity waves?	161
9.10	X-rays betray black holes in binary stars	162
9.11	The best candidate sits at the center of the Milky Way	163
9.12	Supermassive objects in the nuclei of other galaxies	164
9.13	Approaching the horizon...	165
9.14	... may offer unexpected surprises	166
9.15	The rapid variability of quasars as probe of gravity	167
9.16	Cosmology requires relativistic and quantum gravity	168
Chapter 10	Dark matter – the grey eminence	171
10.1	Early signs of dark matter	171
10.2	Invisible matter makes galaxies revolve rapidly	172
10.3	Gravity lenses probe the dark matter	173
10.4	MACHOs in the halo of the Milky Way	175
10.5	Do Arp’s quasars reveal dark matter in galaxy haloes?	176
10.6	Much more in a cluster of galaxies than the eye sees	177
10.7	The total amount of dark matter in the universe	178
10.8	An ocean of massive neutrinos?	179
10.9	The search for dark matter goes on	181
Chapter 11	Dark energy – the new emperor	183
11.1	Revolution in cosmology – Einstein’s lambda returns!	183
11.2	A short course in the physics of “nothing”	186
11.3	Dark energy, quintessence, spintessence...	187
11.4	A bit of history: redshift and de Sitter’s effect	188
11.5	The age of an accelerating universe	189

11.6	The fifth element may rule in your backyard	190
------	---	-----

Chapter 12 Expansion and curvature of space 193

12.1	The nature of redshift – Allan Sandage’s 15th problem	193
12.2	Understanding the expansion of space	196
12.3	The Lemâitre phenomenon versus the Doppler effect	198
12.4	What is the fate of energy in expanding space?	200
12.5	Superluminal recession of remote galaxies	202
12.6	Geometry and physics: views of Poincaré and Einstein	203
12.7	Absolutely soft and hard meter sticks	204
12.8	Geometry of space in the local galaxy universe	205
12.9	The classical cosmological tests of space geometry	206
12.10	The patchy microwave sky brings Euclid back	209
12.11	The enigmatic unity of space, matter, and energy	210

PART IV THE FRACTAL ARCHITECTURE OF THE UNIVERSE 213

Chapter 13 Cosmic hierarchies: from dream to science 215

13.1	Searching the heavens for nebulae	215
13.2	John Herschel’s principle of subordinate grouping	217
13.3	Fournier d’Albe’s brave new worlds	218
13.4	Gravity within Fournier’s hierarchy	221
13.5	Carl Charlier wrestles with infinities	221
13.6	Charlier’s criteria for infinite worlds	223
13.7	Towards hierarchic worlds without a middle point	224
13.8	Knut Lundmark’s great plan	226

Chapter 14 The charm of self-similarity 229

14.1	The “fractal orbit” of Mandelbrot	229
14.2	The concept of the fractal	231
14.3	Koch’s curve or snow flake	233
14.4	The simple measure of complex structures	234
14.5	The fractal dimension of Fournier-Charlier worlds	236
14.6	Creativity of fractals	237
14.7	Random fractals and Brownian motion	239
14.8	Percolation – a process leading to fractals	240

14.9	Fractal structures versus smooth distributions	240
14.10	Fractal view of Nature	242
14.11	The fractal dimension of abstract art	244
Chapter 15 Fractal and chaos: planets, stardust, dark haloes		247
15.1	Order and chaos revealed by the Solar System	247
15.2	Chaos, strange attractors, and fractals	250
15.3	How a pendulum connects chaos and fractals	252
15.4	“Protochaos” in Swedenborg’s vision of evolution	254
15.5	To the microcosmos – and back to the planets again: Nottale’s fractal space-time	255
15.6	Rugged planetary landscapes	258
15.7	Dense dust clouds – cocoons of stars	260
15.8	A case study of natural fractals: interstellar clouds	262
15.9	Dark clouds, molecular complexes, cirrus filaments.	264
15.10	Galaxy haloes – dark mass hiding in fractals?	266
15.11	Fractal gas clouds between galaxies	268
Chapter 16 Redshift – the quiet cosmographer		269
16.1	Hubble’s law of redshifts is a distance indicator	269
16.2	The Hubble constant measured before Hubble.	271
16.3	The Hubble constant: 100 or 72 or 50?	272
16.4	Distances to galaxies – a mission impossible?	272
16.5	The notorious Malmquist bias	276
16.6	What, after all, is the value of the Hubble constant?	277
16.7	Galaxy clusters painted on the celestial sphere	278
16.8	The origin of the debate on superclusters	279
16.9	Abell’s rich clusters of galaxies	281
16.10	Looking through the dusty window	282
16.11	3-D astronomy from the vertex of a space cone	284
16.12	Excursions into the local galaxy universe and beyond	287
16.13	The mysterious quietness of the Hubble flow	289
16.14	The redshift of quasars as a distance indicator	292
Chapter 17 Fractal structure of the galaxy universe		295
17.1	Einstein’s Cosmological Principle	295
17.2	Many faces of the Cosmological Principle	297
17.3	The derivation of uniformity from local isotropy	298

17.4	The galaxy universe may seem rather smooth...	300
17.5	... but the uniformity is elusive	301
17.6	Carpenter – de Vaucouleurs’s law of galaxy clustering	302
17.7	Mandelbrot’s fractal view of galaxy clustering	305
17.8	Does isotropy always imply uniformity?	306
17.9	Do we live on the peak of a mountain?	308
17.10	Modern redshift surveys of galaxies	311
17.11	Pietronero and the five megaparsec mystery	312
17.12	The Great Fractal Debate	314
17.13	The correlation function points at 5 Mpc	317
17.14	The conditional density comes and finds fractality	318
17.15	To search for or to count on uniformity?	321
17.16	Towards Einstein–Mandelbrot concordance	322
17.17	Everything we know about the cosmos?	324
17.18	Opening the millenium: the race to a fair sample	325
Chapter 18 The Origins of Megafractals		329
18.1	The ladder of key discoveries	329
18.2	The three whales of cosmology	331
18.3	The art of making universes	332
18.4	Art is long, life is short	334
18.5	Growth of large scale structures in big bang cosmology	336
18.6	The smooth Hubble law ignores local roughness	339
18.7	Gravitational redshift inside a fractal structure	342
18.8	A Friedmann universe with fractal galaxy distribution	343
18.9	Dark energy drives the remote and the local universe	343
18.10	Early work around fractal dimension one...	345
18.11	...and intriguing aspects of fractal dimension two	345
18.12	The fractal state of many gravitating particles	347
18.13	Cosmological questions within quantum field gravity	350
18.14	The cosmic architecture of complexity	351
18.15	What is the message of the megafractals?	353
18.16	Through deeper observations to novel perspectives	355
Appendix A		359
A.1	Definition of the astronomical magnitude	359
A.2	The mass of the Milky Way	359
A.3	A standard candle in the Hubble diagram	360

A.4	The classical electron and gravitational radiuses	360
A.5	The cosmological gravitational redshift	360
	Suggestions for Reading	361
	Index	363
