<i>Preface</i>	v
1. Introduction to Stability Theory	1
1.1 Definition of stability	1
1.2 Equations for disturbed motion	2
1.3 Linear autonomous system	4
1.4 Introduction of parameters	6
1.5 Stability theorems based on first approximation	7
1.6 Mechanical systems	9
1.7 Asymptotic stability criteria for mechanical systems	14
2. Bifurcation Analysis of Eigenvalues	21
2.1 Eigenvalue problem	22
2.2 Multiple eigenvalues and the Jordan canonical form	22
2.3 Left eigenvectors and Jordan chains	26
2.4 Perturbation of simple eigenvalue	29
2.5 Bifurcation of double eigenvalue with single eigenvector	33
2.6 Strong interaction of two eigenvalues	41
2.6.1 Real eigenvalue λ_0	43
2.6.2 Complex eigenvalue λ_0	44
2.7 Bifurcation of nonderogatory eigenvalue of arbitrary multiplicity	50
2.8 Bifurcation of double semi-simple eigenvalue	54
2.9 Weak interaction of eigenvalues	57
2.9.1 Real eigenvalue λ_0	59
2.9.2 Complex eigenvalue λ_0	65

2.10	Bifurcation of semi-simple eigenvalue of arbitrary multiplicity	68
2.11	Bifurcation of multiple eigenvalues with arbitrary Jordan structure	70
2.12	Generalized eigenvalue problem	71
2.12.1	Simple eigenvalue	72
2.12.2	Semi-simple eigenvalue	73
2.12.3	Nonderogatory eigenvalue	74
2.13	Eigenvalue problem for vibrational system	76
2.13.1	Simple eigenvalue	77
2.13.2	Semi-simple eigenvalue	77
2.13.3	Nonderogatory eigenvalue	78
3.	Stability Boundary of General System Dependent on Parameters	83
3.1	Stability and dynamics of linear system	84
3.2	Stability domain and its boundary	87
3.3	Case of general position	88
3.4	Stability boundary: qualitative analysis	92
3.4.1	Regular part	92
3.4.2	Singularities of codimension 2	94
3.4.3	Singularities of codimension 3	96
3.5	Quantitative analysis of divergence and flutter boundaries	99
3.6	Quantitative analysis of singularities of codimension 2 . .	101
3.7	Quantitative analysis of singularities of codimension 3 . .	106
4.	Bifurcation Analysis of Roots and Stability of Characteristic Polynomial Dependent on Parameters	117
4.1	Stability of ordinary differential equation of m th order . .	118
4.2	Stability domain for characteristic polynomial dependent on parameters	122
4.3	Perturbation of simple roots	123
4.4	Bifurcation analysis of multiple roots (nondegenerate case)	125
4.5	Bifurcation analysis of multiple roots (degenerate case) .	128
4.6	Regular part of stability boundary	132
4.7	Singularities of stability boundary (codimension 2 and 3)	134
4.8	Reduction to polynomial of lower order by the Weierstrass preparation theorem	140

4.9	Approximation of stability domain near singularities (general case)	143
5.	Vibrations and Stability of Conservative System	149
5.1	Vibrations and stability	150
5.2	Sensitivity of simple and multiple frequencies	154
5.3	Stability domain and its boundary	156
5.4	Singularities of stability boundary	159
5.5	Buckling problem of column loaded by axial force	163
5.6	Effect of small dissipative forces on eigenvalues and stabil- ity of conservative system	166
6.	Gyroscopic Stabilization	169
6.1	General properties of gyroscopic system	169
6.2	Positive definite stiffness matrix	170
6.2.1	Sensitivity analysis of vibration frequencies	172
6.3	Loss of stability	175
6.3.1	Strong interaction	176
6.3.2	Weak interaction	177
6.3.3	Further increase of parameter p	178
6.4	Gyroscopic stabilization problem	185
7.	Linear Hamiltonian Systems	191
7.1	Stability and dynamics of Hamiltonian system	192
7.1.1	Linearization near equilibrium	192
7.1.2	Stability and instability	193
7.1.3	Relation to gyroscopic system	195
7.2	Bifurcation of purely imaginary and zero eigenvalues of Hamiltonian matrix	196
7.2.1	Simple eigenvalue	197
7.2.2	Double eigenvalue with single eigenvector	197
7.2.3	Double semi-simple eigenvalue	199
7.3	Versal deformation of Hamiltonian matrix	201
7.4	Stability domain and its boundary	205
7.5	Singularities of stability boundary	207
7.6	Stability analysis near singularities associated with double eigenvalues	211

7.7	Stability analysis near singularities associated with eigenvalues of multiplicity $k > 2$	214
7.8	Mechanical examples	222
7.8.1	Elastic simply supported pipe conveying fluid	222
7.8.2	Gyroscopic stabilization of statically unbalanced rotating system	225
8.	Mechanical Effects Associated with Bifurcations and Singularities	233
8.1	Stability and catastrophes in one-parameter circulatory systems	234
8.2	Transfer of instability between eigenvalue branches	240
8.2.1	Pipe conveying fluid	241
8.2.2	Flutter instability	243
8.2.3	Strong interaction of complex eigenvalues	244
8.3	Destabilization of non-conservative system by small damping	246
8.3.1	Double pendulum with follower force	249
8.3.2	Stabilization effect in case of two damping parameters	252
8.4	Disappearance of flutter instability in the Keldysh problem	254
8.4.1	Aeroelastic stability problem	255
8.4.2	Behavior of eigenvalue branches on the complex plane	259
8.4.3	Wing with B-type strut	262
8.4.4	Generalization	263
9.	Stability of Periodic Systems Dependent on Parameters	267
9.1	Stability of periodic solution	268
9.2	Floquet theory	271
9.3	Derivatives of Floquet matrix with respect to parameters	278
9.4	Stability analysis of the Mathieu equation	283
9.5	Sensitivity analysis of simple multipliers	289
9.6	Numerical applications	291
9.6.1	Axially loaded beam	291
9.6.2	Optimization problem	293
9.6.3	Results of optimization	296

9.6.4	Stabilization of unstable system: Carson-Cambi equation	298
9.7	Bifurcation of multipliers	300
9.7.1	Nonderogatory double multiplier	300
9.7.2	Nonderogatory triple multiplier	301
9.7.3	Semi-simple double multiplier	303
9.8	Numerical examples on interaction of multipliers	304
9.8.1	Parametric resonance	305
9.8.2	Combination resonance	307
10.	Stability Boundary of General Periodic System	309
10.1	Stability boundary of periodic system	310
10.2	Singularities of stability boundary	314
10.3	Quantitative analysis of singularities	319
10.4	Stability of two elastically attached pipes conveying pulsating flow	326
11.	Instability Domains of Oscillatory System with Small Parametric Excitation and Damping	333
11.1	Instability domains for the Hill equation with damping	334
11.2	Oscillatory systems with m degrees of freedom: simple and combination resonance points	341
11.3	Behavior of simple multipliers	344
11.4	Local approximation of stability domain for simple and combination resonances	346
11.5	Special cases of parametric excitation	350
11.5.1	Symmetric matrix of parametric excitation	350
11.5.2	Matrix of parametric excitation $\mathbf{B}(\Omega t) = \varphi(\Omega t)\mathbf{B}_0$	352
11.6	One degree of freedom system	353
11.7	Influence of dissipative forces on instability domain	354
11.7.1	Small dissipative forces	354
11.7.2	Instability domain for system without dissipation	356
11.7.3	Effect of destabilization by infinitely small dissipative forces	357
11.8	Applications	359
11.8.1	Beam loaded by periodic bending moments (Bolotin's problem)	359

11.8.2	Beam of variable cross-section loaded by periodic axial force	361
12.	Stability Domains of Non-Conservative System under Small Parametric Excitation	365
12.1	Stability of non-conservative periodic system	366
12.2	Approximation of the stability domain in regular case . .	368
12.3	Local analysis of the stability domain in singular case . .	371
12.3.1	Method of versal deformations	372
12.3.2	Approximation of the stability domain	374
12.3.3	Two-parameter case	376
12.3.4	Three-parameter case	377
12.3.5	General case $n \geq 4$	380
12.4	Stability of pipe conveying pulsating fluid	380
12.4.1	Discretization by Galerkin's method	382
12.4.2	Flow with constant velocity	383
12.4.3	Stability domain in regular case	383
12.4.4	Stability domain in singular case	384
12.4.5	Stability diagrams on the amplitude-frequency plane	387
	<i>Concluding Remarks</i>	389
	<i>Bibliography</i>	391
	<i>Index</i>	401
