<b>Preface</b>	<b>xvii</b>
<b>Preface to the Third Edition</b>	<b>xix</b>
<b>General Sources and References</b>	<b>xxiii</b>
<b>PART I BASIC IDEAS AND TECHNIQUES</b>	
<b>1 Pertinent concepts and ideas in the theory of critical phenomena</b>	<b>3</b>
1-1 Description of critical phenomena	3
1-2 Scaling and homogeneity	5
1-3 Comparison of various results for critical exponents	6
1-4 Universality — dimensionality, symmetry	8
Exercises	9

<b>2</b>	<b>Formulation of the problem of phase transitions in terms of functional integrals</b>	<b>11</b>
2-1	Introduction	11
2-2	Construction of the Lagrangian	12
2-2-1	The real scalar field	12
2-2-2	Complex field	12
2-2-3	A hypercubic $n$ -vector model	13
2-2-4	Two coupled fluctuating fields	14
2-3	The parameters appearing in $\mathcal{L}$	14
2-4	The partition function, or the generating functional	15
2-5	Representation of the Ising model in terms of functional integrals	18
2-5-1	Definition of the model and its thermodynamics	18
2-5-2	The Gaussian transformation	21
2-5-3	The free part	22
2-5-4	Some properties of the free theory — a free Euclidean field theory in less than four dimensions	26
2-6	Correlation functions including composite operators	28
	Exercises	30
<b>3</b>	<b>Functional integrals in quantum field theory</b>	<b>33</b>
3-1	Introduction	33
3-2	Functional integrals for a quantum-mechanical system with one degree of freedom	34
3-2-1	Schwinger's transformation function	34
3-2-2	Matrix elements — Green functions	37
3-2-3	The generating functional	38
3-2-4	Analytic continuation in time — the Euclidean theory	40
3-3	Functional integrals for the scalar boson field theory	41
3-3-1	Introduction	41
3-3-2	The generating functional for Green functions	43
3-3-3	The generating functional as a functional integral	44
3-3-4	The $S$ -matrix expressed in terms of the generating functional	47
	Exercises	50

<b>4 Perturbation theory and Feynman graphs</b>	<b>53</b>
4-1 Introduction	53
4-2 Perturbation expansion in coordinate space	54
4-3 The cancellation of vacuum graphs	60
4-4 Rules for the computation of graphs	60
4-5 More general cases	63
4-5-1 The $M$ -vector theory	63
4-5-2 Comments on fields with higher spin	67
4-6 Diagrammatic expansion in momentum space	68
4-7 Perturbation expansion of Green functions with composite operators	72
4-7-1 In coordinate space	72
4-7-2 In momentum space	74
4-7-3 Insertion at zero momentum	76
Exercises	77
<b>5 Vertex functions and symmetry breaking</b>	<b>80</b>
5-1 Introduction	80
5-2 Connected Green functions and their generating functional	82
5-3 The mass operator	85
5-4 The Legendre transform and vertex functions	86
5-5 The generating functional and the potential	91
5-6 Ward-Takahashi identities and Goldstone's theorem	94
5-7 Vertex parts for Green functions with composite operators	96
Exercises	101
<b>6 Expansions in the number of loops and in the number of components</b>	<b>103</b>
6-1 Introduction	103
6-2 The expansion in the number of loops as a power series	104
6-3 The tree (Landau-Ginzburg) approximation	105
6-4 The one-loop approximation and the Ginzburg criterion	109
6-5 Mass and coupling constant renormalization in the one-loop approximation	112

6-6	Composite field renormalization	116
6-7	Renormalization of the field at the two-loop level	117
6-8	The $O(M)$ -symmetric theory in the limit of large $M$	126
6-8-1	General remarks	126
6-8-2	The origin of the $M$ -dependence of the coupling constant	127
6-8-3	Faithful representation of graphs and the dominant terms in $\Gamma^{(4)}$	128
6-8-4	$\Gamma^{(2)}$ in the infinite $M$ limit	130
6-8-5	Renormalization	133
6-8-6	Broken symmetry	134
Appendix 6-1	The method of steepest descent and the loop expansion	137
	Exercises	142
<b>7</b>	<b>Renormalization</b>	<b>147</b>
7-1	Introduction	147
7-2	Some considerations concerning engineering dimensions	148
7-3	Power counting and primitive divergences	151
7-4	Renormalization of a cutoff $\phi^4$ theory	157
7-5	Normalization conditions for massive and massless theories	159
7-6	Renormalization constants for a massless theory to order two loops	161
7-7	Renormalization away from the critical point	164
7-8	Counterterms	167
7-9	Relevant and irrelevant operators	169
7-10	Renormalization of a $\phi^4$ theory with an $O(M)$ symmetry	171
7-11	Ward identities and renormalization	174
7-12	Iterative construction of counterterms	179
	Exercises	185
<b>8</b>	<b>The renormalization group and scaling in the critical region</b>	<b>189</b>
8-1	Introduction	189
8-2	The renormalization group for the critical (massless) theory	190
8-3	Regularization by continuation in the number of dimensions	195

8-4	Massless theory below four dimensions — the emergence of $\epsilon$	196
8-5	The solution of the renormalization group equation	197
8-6	Fixed points, scaling, and anomalous dimensions	199
8-7	The approach to the fixed point — asymptotic freedom	201
8-8	Renormalization group equation above $T_c$ — identification of $\nu$	205
8-9	Below the critical temperature — the scaling form of the equation of state	208
8-10	The specific heat — renormalization group equation for an additively renormalized vertex	210
8-11	The Callan-Symanzik equations	212
8-12	Renormalization group equations for the bare theory	214
8-13	Renormalization group equations and scaling in the infinite $M$ limit	217
Appendix 8-1	General formulas for calculating Feynman integrals	222
	Exercises	223
<b>9</b>	<b>The computation of the critical exponents</b>	<b>228</b>
9-1	Introduction	228
9-2	The symbolic calculation of the renormalization constants and Wilson functions	230
9-3	The $\epsilon$ expansion of the critical exponents	233
9-4	The nature of the fixed points — universality	237
9-5	Scale invariance at finite cutoff	238
9-6	At the critical dimension — asymptotic infrared freedom	240
9-7	$\epsilon$ expansion for the Callan-Symanzik method	243
9-8	$\epsilon$ expansion of the renormalization group equations for the bare functions	247
9-9	Dimensional regularization and critical phenomena	248
9-10	Renormalization by minimal subtraction of dimensional poles	250
9-11	The calculation of exponents in minimal subtraction	255
Appendix 9-1	Calculation of some integrals with cutoff	257
	9-2 One-loop integrals in dimensional regularization	260
	9-3 Two-loop integrals in dimensional regularization	263
	Exercises	266

**PART II FURTHER APPLICATIONS AND DEVELOPMENTS**

<b>1 Introduction</b>	<b>273</b>
<b>2 Beyond leading scaling</b>	<b>275</b>
2-1 Corrections to scaling in a $\phi^4$ theory	275
2-2 Finite-size scaling	277
2-3 Anomalous dimensions of high composite operators	280
2-4 Corrections due to irrelevant operators	288
2-5 Next-to-leading terms in the scaling region	293
2-6 The operator product expansion	295
2-7 Computation of next-to-leading terms in $\epsilon$ -expansion	297
Appendix 2-1 Renormalized equations of motion	300
Exercises	306
<b>3 Universality revisited</b>	<b>310</b>
3-1 Renormalization scheme independence of critical exponents	310
3-2 The universal form of the equation of state	311
3-3 The equation of state to order $\epsilon$	314
3-4 Two scale factor universality — universal ratios of amplitudes	316
Exercises	320
<b>4 Critical behavior with several couplings</b>	<b>323</b>
4-1 Introduction	323
4-2 More than one coupling constant — cubic anisotropy	324
4-3 Runaway trajectories	328
4-4 First order transitions induced by fluctuations: the Coleman-Weinberg mechanism	330
4-5 Geometrical description of the Coleman-Weinberg phenomenon	337
Exercises	339
<b>5 Crossover phenomena</b>	<b>342</b>
5-1 Introduction	342
5-2 Crossover in magnetic systems interacting quadratically and the Harris criterion for relevance of random dilution	343

5-3	The crossover exponent at a bicritical point: scale invariance with quadratic symmetry breaking	346
5-4	The crossover function at a bicritical point: a case study of renormalization group analysis in the presence of two lengths	350
	Exercises	361
<b>6</b>	<b>Critical phenomena near two dimensions</b>	<b>364</b>
6-1	An alternative field theory for the Heisenberg model — the low temperature phase	364
6-2	Perturbation theory for the non-linear sigma model	368
6-2-1	The free propagator and infrared regularization	369
6-2-2	Disposing of the measure	369
6-2-3	The interactions	370
6-2-4	The expansion of $\Gamma_\alpha^{(2)}$	370
6-3	Renormalization group treatment of the non-linear sigma model	372
6-4	Scaling behavior and critical exponents	376
Appendix 6-1	Renormalization of the non-linear sigma model	378
	Exercises	380
<b>PART III NONPERTURBATIVE AND NUMERICAL METHODS</b>		
<b>1</b>	<b>Real space methods</b>	<b>385</b>
1-1	Introduction	385
1-1-1	Lattice models	386
1-1-2	Brief visit to high temperature expansion	390
1-1-3	High order expansions and critical behavior	394
1-2	Real space renormalization group	395
1-2-1	The 1- $d$ Ising model	400
1-2-2	2- $d$ Ising model	403
1-2-3	General case	409
1-3	At and around a fixed point	414
1-3-1	Scaling of the correlation functions	418
1-3-2	Renormalized trajectory	424
1-4	The large $M$ model	427

1-4-1	Path integral and saddle point	428
1-4-2	The propagator	430
1-4-3	Factorization	431
1-4-4	Gap equation	433
1-4-5	The exponent $\nu$	434
1-4-6	Example of real-space RG-transformation	436
	Exercises	439
<b>2</b>	<b>Finite size scaling</b>	<b>446</b>
2-1	Introduction	446
2-1-1	Geometry and boundary conditions	449
2-1-2	The finite size scaling ansatz	452
2-2	The RG derivation of finite size scaling	456
2-2-1	Logarithmic specific heat	460
2-2-2	Order parameter probability	461
2-2-3	Corrections to scaling	464
2-2-4	First-order phase transitions	469
2-3	Applications of FSS	470
2-3-1	Finite lattice correlation length	471
2-3-2	Extrapolations to infinite volume	474
2-3-3	Working at the critical point	476
	Exercises	480
<b>3</b>	<b>Monte Carlo methods. Numerical field theory</b>	<b>486</b>
3-1	Introduction	486
3-1-1	Motivations	486
3-1-2	Static Monte Carlo methods: first example	487
3-1-3	Problems with uniform sampling	490
3-2	Dynamic Monte Carlo	492
3-2-1	Methods for the Ising model	496
3-2-2	Methods for the O(3) non-linear $\sigma$ -model	497
3-3	Data analysis	499
3-3-1	General considerations	499

3-3-2 Practical recipes	503
3-4 Cluster methods	509
3-4-1 Discrete spins	510
3-4-2 Performance	513
3-4-3 Continuous spins	514
3-4-4 Final remark	515
Exercises	516
<b>Appendix A Sample Programs*</b>	
A-1 Static Monte Carlo Integration	
A-2 Simulation of 2-D Ising Model	
A-3 Autocorrelation Analysis	
A-4 Data Analysis	
Author Index	521
Subject Index	527
