<i>Preface</i>	vii
1. Introduction	1
1.1 A brief historical overview	1
1.2 Summary of content	2
1.3 References - Chapter 1	9
2. Hydrodynamic Background	11
2.1 Introduction	11
2.2 Kinematics of fluid flow	12
2.2.1 Eulerian versus Lagrangian description	12
2.2.2 Streamlines, pathlines, streaklines	13
2.2.3 Vorticity ω_i and deformation tensor e_{ij}	14
2.2.4 Gauss' theorem, Green's theorems	15
2.2.5 The kinematic transport theorem, Leibniz rule	16
2.3 Dynamics of fluid flow	17
2.3.1 Conservation of mass	17
2.3.2 Conservation of momentum	18
2.3.3 Stokes' viscosity law, the Navier-Stokes equations	20
2.3.4 The boundary layer approximation	22
2.3.5 Energy dissipation in viscous flow	23
2.3.6 The Euler equations, irrotational flow	23
2.4 Conditions at fixed and moving boundaries	24
2.4.1 Kinematic conditions	25
2.4.2 Dynamic conditions	27
2.5 Basic ideas for turbulent flow	28

2.5.1	Reynolds' decomposition of physical quantities . . .	29
2.5.2	Determination of the turbulent mean flow	30
2.5.3	The Reynolds equations	34
2.5.4	Modelling of turbulent stresses	39
2.6	Energy flux in a flow	43
2.7	Appendix: Tensor notation	45
2.8	References - Chapter 2	47
3.	Linear Waves	49
3.1	Assumptions and the simplified equations	49
3.2	Basic solution for linear waves	55
3.2.1	Solution for ϕ and η	55
3.2.2	Evaluation of linear waves	66
3.2.3	Particle motion	72
3.2.4	The pressure variation	77
3.2.5	Deep water and shallow water approximations	80
3.3	Time averaged properties of linear waves in one horizontal dimension (1DH)	88
3.3.1	Introduction	88
3.3.2	Mass and volume flux	89
3.3.3	Momentum flux—radiation stress	92
3.3.4	Energy density	97
3.3.5	Energy flux	99
3.3.6	Dimensionless functions for wave averaged quantities	100
3.4	Superposition of linear waves	102
3.4.1	Standing waves	103
3.4.2	Wave groups	108
3.4.3	Wave spectra	113
3.5	Linear wave propagation over uneven bottom	126
3.5.1	Introduction	126
3.5.2	Shoaling and refraction	131
3.5.2.1	Simple shoaling	135
3.5.2.2	Determination of the refraction pattern	138
3.5.3	Refraction by ray tracing	142
3.5.4	The geometrical optics approximation	144
3.5.5	Kinematic wave theory	151
3.6	Wave modification by currents	154
3.6.1	Introduction	154

3.6.2	Waves on a steady, locally uniform current	155
3.6.3	Vertically varying currents	160
3.6.4	The kinematics and dynamics of wave propagation on current fields	165
3.7	Combined refraction-diffraction	166
3.7.1	Introduction	166
3.7.2	The wave equation for linear long waves	168
3.7.3	The mild slope equation	171
3.7.4	Further developments of the MSE	179
3.7.5	The parabolic approximation	189
3.8	References - Chapter 3	199
4.	Energy Balance in the Nearshore Region	207
4.1	Introduction	207
4.2	The energy equation	207
4.3	The energy balance for periodic waves	213
4.3.1	Introduction of dimensionless parameters for 1-D wave motion	213
4.3.2	A closed form solution of the energy equation	215
4.3.3	The energy equation for steady irregular waves	221
4.4	The general energy equation: Unsteady wave-current motion	222
4.5	The wave action equation	227
4.6	References - Chapter 4	228
5.	Properties of Breaking Waves	229
5.1	Introduction	229
5.2	The highest possible wave on constant depth	230
5.3	Qualitative description of wave breaking	232
5.3.1	Analysis of the momentum variation in a transition (Or: Why do the waves break?)	238
5.4	Wave characteristics at the breakpoint	242
5.5	Experimental results for surfzone waves	246
5.5.1	Qualitative surfzone characteristics	247
5.5.2	The phase velocity c	248
5.5.3	Surface profiles $\eta(t)$	250
5.5.4	The surface shape parameter B_0	252
5.5.5	The crest elevation η_c/H	254

5.5.6	The roller area	255
5.5.7	Measurements of particle velocities	258
5.5.8	Turbulence intensities	262
5.5.9	The values of P_{xx} , B_x and D	263
5.5.10	The wave generated shear stress $\overline{u_w w_w}$	269
5.6	Surfzone wave modelling	271
5.6.1	Surfzone assumptions	271
5.6.2	Energy flux E_f for surfzone waves	274
5.6.3	Radiation stress in surfzone waves	279
5.6.4	Volume flux in surfzone waves	281
5.6.5	The phase velocities for quasi-steady breaking waves	282
5.6.6	The energy dissipation in quasi steady surfzone waves	285
5.7	Further analysis of the energy dissipation	287
5.7.1	Energy dissipation for random waves	287
5.7.2	Energy dissipation with a threshold	291
5.7.3	A model for roller energy decay	292
5.7.4	Advanced computational methods for surfzone waves	293
5.8	Swash	295
5.9	References - Chapter 5	303
6.	Wave Models Based on Linear Wave Theory	311
6.1	Introduction	311
6.2	1DH shoaling-breaking model	313
6.3	2DH refraction models	313
6.3.1	The wave propagation pattern	313
6.3.2	Determination of the wave amplitude variation	317
6.4	Wave action models	318
6.5	Models based on the mild slope equation and the parabolic approximation	319
6.6	References - Chapter 6	320
7.	Nonlinear Waves: Analysis of Parameters	323
7.1	Introduction	323
7.2	The equations for the classical nonlinear wave theories	325
7.3	The system of dimensionless variables used	328

7.4	Stokes waves	331
7.5	Long waves	333
7.5.1	The Stokes or Ursell parameter	335
7.5.2	Long waves of moderate amplitude	335
7.5.3	Long waves of small amplitude	336
7.5.4	Long waves of large amplitude	337
7.6	Conclusion	338
7.7	References - Chapter 7	338
8.	Stokes Wave Theory	341
8.1	Introduction	341
8.2	Second order Stokes waves	342
8.2.1	Development of the perturbation expansion	342
8.2.2	First order approximation	345
8.2.3	Second order approximation	346
8.2.4	The solution for ϕ_2	349
8.2.5	The surface elevation η	351
8.2.6	The pressure p	355
8.2.7	The volume flux and determination of K	358
8.2.8	Stokes' two definitions of the phase velocity	362
8.2.9	The particle motion	364
8.2.10	Convergence and accuracy	366
8.3	Higher order Stokes waves	369
8.3.1	Introduction	369
8.3.2	Stokes third order theory	370
8.3.3	Waves with currents	371
8.3.4	Stokes fifth order theory	372
8.3.5	Very high order Stokes waves	373
8.4	The stream function method	374
8.4.1	Introduction	374
8.4.2	Description of the stream function method	374
8.4.3	Comparison of stream function results with a Stokes 5th order solution	378
8.5	References - Chapter 8	379
9.	Long Wave Theory	381
9.1	Introduction	381
9.2	Solution for the Laplace equation	383

9.3	The Boussinesq equations	387
9.4	Boussinesq equations in one variable	389
9.4.1	The fourth order Boussinesq equation	389
9.4.2	The third order Korteweg-deVries (KdV) equation	392
9.5	Cnoidal waves – Solitary waves	396
9.5.1	The periodic case: Cnoidal waves	399
9.5.2	Final cnoidal wave expressions	402
9.5.3	Infinitely long waves: Solitary waves	406
9.6	Analysis of cnoidal waves for practical applications	410
9.6.1	Specification of the wave motion	411
9.6.2	Velocities and pressures	415
9.6.3	Wave averaged properties of cnoidal waves	420
9.6.4	Limitations for cnoidal waves	423
9.7	Alternative forms of the Boussinesq equations - The linear dispersion relation	425
9.7.1	Equations in terms of the velocity u_0 at the bottom	426
9.7.2	Equations in terms of the velocity u_s at the MWS	426
9.7.3	The equations in terms of the depth averaged velocity \tilde{u}	427
9.7.4	The equations in terms of Q	429
9.7.5	The linear dispersion relation	430
9.8	Equations for 2DH and varying depth	435
9.9	Equations with enhanced deep water properties	437
9.9.1	Introduction	437
9.9.2	Improvement of the linear dispersion properties	437
9.9.3	Improvement of other properties	442
9.10	Further developments of Boussinesq modelling	444
9.10.1	Fully nonlinear models	445
9.10.2	Extension of equations to $O(\mu^4)$ accuracy	445
9.10.3	Waves with currents	446
9.10.4	Models of high order	446
9.10.5	Robust numerical methods	446
9.10.6	Frequency domain methods for solving the equations	447
9.11	Boussinesq models for breaking waves	448
9.11.1	Eddy viscosity models	449
9.11.2	Models with roller enhancement	449
9.11.3	Vorticity models	450

9.11.4	Wave breaking modelled by the nonlinear shallow water equations	451
9.12	Large amplitude long waves $U \gg 1$: The nonlinear shallow water equations (NSW)	451
9.13	References - Chapter 9	454
10.	Boundary Layers	469
10.1	Introduction	469
10.1.1	The boundary layer equations. Formulation of the problem	470
10.1.2	Perturbation expansion for u	473
10.1.3	The 1st order solution	474
10.1.4	The 2nd order solution	480
10.1.5	The steady streaming u_s in wave boundary layers	483
10.1.6	Results for u_s	486
10.2	Energy dissipation in a linear wave boundary layer	490
10.3	Turbulent wave boundary layers	493
10.3.1	Rough turbulent flow	497
10.3.2	Energy dissipation in turbulent wave boundary layers	500
10.4	Bottom shear stress in 3D wave-current boundary layers	502
10.4.1	Introduction	502
10.4.2	Formulation of the problem	502
10.4.3	The mean shear stress	504
10.4.4	Special cases	509
10.5	References - Chapter 10	513
11.	Nearshore Circulation	515
11.1	Introduction	515
11.2	Depth integrated conservation of mass	518
11.2.1	Separation of waves and currents	520
11.3	Conditions at fixed and moving boundaries, II	523
11.3.1	Kinematic conditions	523
11.3.2	Dynamic conditions	524
11.4	Depth integrated momentum equation	530
11.4.1	Integration of horizontal equations	531
11.4.2	Integration of the vertical momentum equation	533

11.5	The nearshore circulation equations	540
11.5.1	The time averaged momentum equation	540
11.5.2	The equations for depth uniform currents	544
11.6	Analysis of the radiation stress in two horizontal dimensions, 2DH	548
11.6.1	$S_{\alpha\beta}$ expressed in terms of S_m and S_p	551
11.6.2	Radiation stress for linear waves in two horizontal dimensions (2DH)	554
11.7	Examples on a long straight beach	557
11.7.1	The momentum balance	557
11.7.2	The cross-shore momentum balance: Setdown and setup	559
11.7.3	Longshore currents	566
11.7.4	Longshore current solution for a plane beach	573
11.7.5	Discussion of the examples	579
11.8	Wave drivers	581
11.9	Conditions along open boundaries	587
11.9.1	Introduction about open boundaries	587
11.9.2	Absorbing-generating boundary conditions	589
11.9.3	Boundary conditions along cross-shore boundaries	598
11.10	References - Chapter 11	600
12.	Cross-Shore Circulation and Undertow	603
12.1	The vertical variation of currents	603
12.1.1	Introduction	603
12.1.2	The governing equations for the variation over depth of the 3D currents	605
12.2	The cross-shore circulation, undertow	608
12.2.1	Formulation of the 2-D problem and general solution	608
12.2.2	Boundary conditions	610
12.2.3	Solution for the undertow profiles with depth uniform ν_t and α_1	613
12.2.4	Discussion of results and comparison with measurements	615
12.2.5	Solutions including the effect of the boundary layer	618
12.2.6	Undertow outside the surfzone	622
12.2.7	Conclusions	622
12.3	References - Chapter 12	623

13. Quasi-3D Nearshore Circulation Models	627
13.1 Introduction	627
13.2 Governing equations	631
13.2.1 Time-averaged depth-integrated equations	631
13.2.2 Choices for splitting the current	632
13.3 Solution for the vertical velocity profiles	633
13.4 Calculation of the integral terms: The dispersive mixing coefficients	637
13.4.1 Final form of the basic equations	640
13.5 Example: Longshore currents on a long straight coast	641
13.6 Applications and further developments of quasi-3D modelling	645
13.6.1 The start-up of a longshore current	645
13.6.2 Rip currents	647
13.6.3 Curvilinear version of the SHORECIRC model	649
13.6.4 The nearshore community model, NearCoM	654
13.7 References - Chapter 13	655
14. Other Nearshore Flow Phenomena	661
14.1 Infragravity waves	661
14.1.1 Introduction	661
14.1.2 Basic equations for infragravity waves	664
14.1.3 Homogeneous solutions – Free edge waves	666
14.1.4 IG wave generation	673
14.2 Shear instabilities of longshore currents	681
14.2.1 Introduction	681
14.2.2 The discovery of shear waves	681
14.2.3 Derivation of the basic equations	684
14.2.4 Stability analysis of the equations	688
14.2.5 Further analyses of the initial instability	692
14.2.6 Numerical analysis of fully developed shear waves	696
14.3 References - Chapter 14	701
