<i>Preface</i>	vii
----------------	-----

Chapter 1 — Advances in Atomic and Molecular Nanotechnology

Introduction	1
The Importance of Nanoscale	3
Atomic and Molecular Basis of Nanotechnology	5
Some Recent Key Inventions and Discoveries	10
Scanning Tunneling Microscope	10
Atomic Force Microscope	10
Diamondoids	12
Buckyballs	14
Carbon Nanotubes	15
Cyclodextrins, Liposome and Monoclonal Antibody	17
Ongoing Research and Development Activities	19
Future Prospects in Nanoscience and Nanotechnology	25
Conclusions and Discussion	26
Some Important Related INTERNET Sites	27
Bibliography	28

Chapter 2 — Nanosystems Intermolecular Forces and Potentials

Introduction	31
Covalent and Noncovalent Interactions	31
Interatomic and Intermolecular Potential Energies and Forces	33

Experimental and Theoretical Development of Interparticle Potentials	38
Step (1): AFM Measurement and Empirical Modeling	40
Step (2): Theoretical Modeling	44
Linearized Augmented Plane Wave (LAPW)	44
Full-Potential Linearized Augmented Plane Wave (FLAPW)	46
Step (3): Development of Nanoparticle Potentials	48
Phenomenological Interatomic and Intermolecular Potentials	49
1. Interatomic Potentials for Metallic Systems	50
1.1. The Many-Body Embedded-Atom Model (EAM) Potentials	52
1.2. The Many-Body Finnis and Sinclair (FS) Potentials	54
1.3. The Many-Body Sutton and Chen (SC) Long-Range Potentials	57
1.4. The Many-Body Murrell–Mottram (MM) Potential	59
1.5. The Many-Body Rafii–Tabar and Sutton (RTS) Long-Range Alloy Potentials	62
1.6. Angular-Dependent Potentials	63
2. Interatomic Potentials for Covalently-Bonding Systems	65
2.1. The Tersoff Many-Body C–C, Si–Si and C–Si Potentials	65
2.2. The Brenner–Tersoff-Type First Generation Hydrocarbon Potentials	67
2.3. The Brenner–Tersoff-Type Second Generation Hydrocarbon Potentials	69
3. Interatomic Potential for C–C Non-Covalent Systems	71
3.1. The Lennard–Jones and Kihara Potentials	71
3.2. The exp-6 Potential	72
3.3. The Ruoff–Hickman Potential	72
4. Interatomic Potential for Metal–Carbon System	73
5. Atomic-Site Stress Field	75
Conclusions and Discussion	76
Bibliography	78

Chapter 3 — Thermodynamics and Statistical Mechanics of Small Systems

Introduction	84
Thermodynamic Systems in Nanoscale	87
Energy, Heat and Work in Nanosystems	89
Laws of Thermodynamics	91
The Zero th Law	93
The First Law	94
The Second Law	97
The Third Law	98
Statistical Mechanics of Small Systems	99
Thermodynamics and Statistical Mechanics of Nonextensive Systems	101
Euler's Theorem of Homogenous Functions	102
Boltzmann and Boltzmann–Gibbs Formulae of Entropy	104
Tsallis Formula of Entropy	105
Microcanonical Ensemble for Nonextensive Systems	109
Canonical Ensemble for Nonextensive Systems	111
Conclusions and Discussion	112
Bibliography	114

Chapter 4 — Monte Carlo Simulation Methods for Nanosystems

Introduction	117
Generating Random Numbers	118
Generating Uniformly Distributed Random Numbers in [0,1)	118
Generating Random Numbers in [a,b) According to a Given Distribution Function P(x)	120
Importance Sampling	120
Monte Carlo Integration Method	122
Applications to Nanosystems Composed of a Few Particles	126

Equilibrium Statistical Mechanics and Monte Carlo Method	128
The Markov Process	128
Choice of the Transition Function	132
Example	133
Acceptance Ratios and Choice of the Moves	134
Other Tricks to Improve the Simulation Speed	136
Application of Monte Carlo to Nonequilibrium Problems	138
The Langevin Equation	138
Interacting Systems	141
Conclusions and Discussion	143
Bibliography	145

Chapter 5 — Molecular Dynamics Simulation Methods for Nanosystems

Introduction	147
Principles of MD Simulation of Nanosystems	149
Integration of Newton Equation of Motion	152
1. The Velet Method	153
2. The Leap-Frog Method	154
3. The Velocity-Verlet Method	154
4. The Gear Predictor-Corrector Method	155
Choice of the Time Increment Δt	156
MD Simulation of Systems in Contact with a Heat Bath: Thermostats	157
1. Velocity Scaling Thermostat	157
2. The Nose-Hoover Extended-System Thermostat	158
3. The Langevin Thermostat	160
Calculations Resulting from MD Simulations	164
Conclusions and Discussion	164
Bibliography	166

Chapter 6 — Computer-Based Simulations and Optimizations for Nanosystems

Introduction	168
A. Classification of Simulation Methods Based on Accuracy and Computational Time	170
Methods with the Highest Degree of Accuracy (Very CPU-Intensive)	171
Methods with the Second Highest Degree of Accuracy	172
Semi-Empirical Methods	172
Stochastic Methods	173
B. Classification of Optimizations in Molecular Simulations	175
Local Optimization Methods	175
1. Steepest Descent Method (SDM)	176
2. Damped Newtonian Dynamics Method	176
3. Conjugate Gradients Method (CGM)	177
4. Quasi-Newton Methods	178
Global Optimization Methods	179
1. Simulated Annealing Method	180
2. Genetic Algorithm	185
Conclusions and Discussion	186
Bibliography	188

Chapter 7 — Phase Transitions in Nanosystems

Introduction	191
The Gibbs Phase Rule	193
Phase Transitions	195
A Comparison of Phase Transitions Between Small and Large Systems	198
Fragmentation	203

Experimental Observations of Phase Transitions in Small Systems	205
1. Evaporation of Water in a Sealed Nanotube	205
2. Micellization and Coacervation	207
3. An Example of Crystallization	210
Conclusions and Discussion	212
Bibliography	214

Chapter 8 — Positional Assembly of Atoms and Molecules

Introduction	217
Positional (or Robotic) Assembly	218
Scanning Probe Microscopy	223
1. Topografiner	223
2. Quantum Mechanical Tunneling Effect	224
3. Piezoelectric Phenomena	226
4. Scanning Tunneling Microscope (STM)	227
5. Electronics Feedback Loop	228
6. Atomic Force Microscope (AFM)	228
Applications of STM for Positional Assembly of Molecules	230
Conclusions and Discussion	234
Bibliography	236

Chapter 9 — Molecular Self-Assembly

Introduction	237
The Five Factors Responsible for Self-Assembly	238
(1). The Role of Molecular Building Blocks (MBBs) in Self-Assembly	238
(2). The Role of Intermolecular Interactions in Self-Assembly	239
(3). Reversibility	240
(4). Molecular Mobility	240
(5). Process Medium	240

Some Examples of Controlled Self-Assemblies	240
(A). Self-Assembly Using Solid Surfaces – Immobilization Techniques	240
(A-1). Affinity Coupling via Antibodies	242
(A-2). Affinity Coupling by Biotin-Streptavidin (Bio-STV) System and Its Modification	242
(A-3). Immobilized Metal Ion Complexation (IMIC)	243
(A-4). Self-Assembled Monolayer (SAM)	245
(A-4-1). Physical Adsorption	245
(A-4-2). Inclusion in Polyelectrolytes or Conducting Polymers	245
(A-4-3). Inclusion in SAM	245
(A-4-4). Non-Oriented Attachment to SAM	246
(A-4-5). Oriented Attachment to SAM	246
(A-4-6). Direct Site-Specific Attachment to Gold	247
(A-5). Strain Directed Self-Assembly	247
(A-6). DNA Directed Self-Assembly	248
(A-7). Self-Assembly on Silicon Surfaces	250
(B). Self-Assembly in Fluid Media	250
Conclusions and Discussion	251
Bibliography	253

Chapter 10 — Dynamic Combinatorial Chemistry

Introduction	255
Dynamic Combinatorial Library (DCL)	258
Challenges and Limitations in Designing a DCL	262
(i) The Nature of DCL Components and Templates	262
(ii) The Types of Intermolecular Interactions in DCL	263
(iii) Thermodynamic Conditions	263
(iv) Methods of a DCL Analysis	264
Molecular Recognition	265

Some Examples and Applications of DCL	268
Host – Guest Chemistry	270
Conclusions and Discussion	275
Bibliography	277

Chapter 11 — Molecular Building Blocks — Diamondoids

Introduction	279
Molecular Building Blocks	280
Diamondoids	288
Some Physical and Chemical Properties of Diamondoid Molecules	288
Synthesis of Diamondoids	292
General Applications of Diamondoids	292
Application of Diamondoids as MBBs	294
Diamondoids for Drug Delivery and Drug Targeting	295
DNA Directed Assembly and DNA-Adamantane-Protein Nanostructures	298
Diamondoids for Host-Guest Chemistry	301
Conclusions and Discussion	302
Bibliography	304
Glossary	307
<i>Index</i>	335
