Foreword	ix
Preface — How Did the Human Brain Evolve?	xiii
Acknowledgements	xvii
Part 1 — The Human Brain: Unique Yet Vulnerable	1
A description of the unique and developmentally vulnerable nature of the human brain: Beginning with an introduction to human evolution and the plasticity of the human brain, it turns to the brain's high energy requirements and the unique role of body fat as energy insurance for the developing brain of babies. The notable need for brain selective nutrients is then described in some detail.

2. The Human Brain: Evolution of Larger Size and Plasticity	25
3. Defining Characteristics: Vulnerability and High Energy Requirement	51
4. Fatness in Human Babies: Insurance for the Developing Brain	75
5. Nutrition: The Key to Normal Human Brain Development	101
6. Iodine: The Primary Brain Selective Nutrient	115
7. Iron, Copper, Zinc and Selenium: The Other Brain Selective Minerals	131
8. Docosahexaenoic Acid: The Brain Selective Fatty Acid	151

Part 2 — The Shore-Based Scenario	175
Assimilation of the nutritional and metabolic constraints on human brain development into a new explanation for how the human brain evolved: Starting with some of the limitations to existing genetic and environmental concepts of human brain evolution, it leads into a description of the shore-based scenario of human evolution, including earlier versions, supporting evidence, and mechanisms for how shore-based nutrition could influence brain evolution.	
9. Genes, Brain Function and Human Brain Evolution	177
10. Bringing the Environment and Diet into Play	191
11. The Shore-Based Scenario: Why Survival Misses the Point	209
12. Earlier Versions	227
13. The Evidence	243
14. How Would It Work?	265
15. Survival of the Fattest	285
