Preface	xv
1 Introduction	1
1.1 Origin and Discovery of Quantum Mechanics	1
1.2 Contradicting Discretization: Uncertainties	7
1.3 Particle-Wave Dualism	12
1.4 Particle-Wave Dualism and Uncertainties	14
1.4.1 Further thought experiments	17
1.5 Bohr's Complementarity Principle	19
1.6 Further Examples	20
2 Hamiltonian Mechanics	23
2.1 Introductory Remarks	23
2.2 The Hamilton Formalism	23
2.3 Liouville Equation, Probabilities	29
2.3.1 Single particle consideration	29
2.3.2 Ensemble consideration	31
2.4 Expectation Values of Observables	34
2.5 Extension beyond Classical Mechanics	38
3 Mathematical Foundations of Quantum Mechanics	41
3.1 Introductory Remarks	41
3.2 Hilbert Spaces	41
3.3 Operators in Hilbert Space	49
3.4 Linear Functionals and Distributions	53
3.4.1 Interpretation of distributions in physics	54
3.4.2 Properties of functionals and the delta distribution . .	55
4 Dirac's Ket- and Bra-Formalism	59
4.1 Introductory Remarks	59
4.2 Ket and Bra States	60

4.3	Linear Operators, Hermitian Operators	62
4.4	Observables	68
4.5	Representation Spaces and Basis Vectors	71
5	Schrödinger Equation and Liouville Equation	73
5.1	Introductory Remarks	73
5.2	The Density Matrix	73
5.3	The Probability Density $\rho(\mathbf{x}, t)$	77
5.4	Schrödinger Equation and Liouville Equation	78
5.4.1	Evaluation of the density matrix	80
6	Quantum Mechanics of the Harmonic Oscillator	83
6.1	Introductory Remarks	83
6.2	The One-Dimensional Linear Oscillator	84
6.3	The Energy Representation of the Oscillator	90
6.4	The Configuration Space Representation	91
6.5	The Harmonic Oscillator Equation	98
6.5.1	Derivation of the generating function	98
7	Green's Functions	105
7.1	Introductory Remarks	105
7.2	Time-dependent and Time-independent Cases	105
7.3	The Green's Function of a Free Particle	111
7.4	Green's Function of the Harmonic Oscillator	113
7.5	The Inverted Harmonic Oscillator	118
7.5.1	Wave packets	118
7.5.2	A particle's sojourn time T at the maximum	123
8	Time-Independent Perturbation Theory	129
8.1	Introductory Remarks	129
8.2	Asymptotic Series versus Convergent Series	130
8.2.1	The error function and Stokes discontinuities	133
8.2.2	Stokes discontinuities of oscillator functions	139
8.3	Asymptotic Series from Differential Equations	143
8.4	Formal Definition of Asymptotic Expansions	146
8.5	Rayleigh-Schrödinger Perturbation Theory	147
8.6	Degenerate Perturbation Theory	152
8.7	Dingle-Müller Perturbation Method	155

9	The Density Matrix and Polarization Phenomena	161
9.1	Introductory Remarks	161
9.2	Reconsideration of Electrodynamics	161
9.3	Schrödinger and Heisenberg Pictures	166
9.4	The Liouville Equation	167
10	Quantum Theory: The General Formalism	169
10.1	Introductory Remarks	169
10.2	States and Observables	169
10.2.1	Uncertainty relation for observables \mathbf{A}, \mathbf{B}	170
10.3	One-Dimensional Systems	173
10.3.1	The translation operator $U(a)$	176
10.4	Equations of Motion	178
10.5	States of Finite Lifetime	184
10.6	The Interaction Picture	185
10.7	Time-Dependent Perturbation Theory	189
10.8	Transitions into the Continuum	191
10.9	General Time-Dependent Method	195
11	The Coulomb Interaction	199
11.1	Introductory Remarks	199
11.2	Separation of Variables, Angular Momentum	199
11.2.1	Separation of variables	205
11.3	Representation of Rotation Group	206
11.4	Angular Momentum: Angular Representation	210
11.5	Radial Equation for Hydrogen-like Atoms	213
11.6	Discrete Spectrum of the Coulomb Potential	215
11.6.1	The eigenvalues	215
11.6.2	Laguerre polynomials: Various definitions in use!	219
11.6.3	The eigenfunctions	223
11.6.4	Hydrogen-like atoms in parabolic coordinates	227
11.7	Continuous Spectrum of Coulomb Potential	234
11.7.1	The Rutherford formula	237
11.8	Scattering of a Wave Packet	239
11.9	Scattering Phase and Partial Waves	243
12	Quantum Mechanical Tunneling	249
12.1	Introductory Remarks	249
12.2	Continuity Equation and Conditions	250
12.3	The Short-Range Delta Potential	251
12.4	Scattering from a Potential Well	254

12.5 Degenerate Potentials and Tunneling	259
13 Linear Potentials	265
13.1 Introductory Remarks	265
13.2 The Freely Falling Particle: Quantization	265
13.2.1 Superposition of de Broglie waves	266
13.2.2 Probability distribution at large times	270
13.3 Stationary States	272
13.4 The Saddle Point or Stationary Phase Method	276
14 Classical Limit and WKB Method	281
14.1 Introductory Remarks	281
14.2 Classical Limit and Hydrodynamics Analogy	282
14.3 The WKB Method	286
14.3.1 The approximate WKB solutions	286
14.3.2 Turning points and matching of WKB solutions	290
14.3.3 Linear approximation and matching	293
14.4 Bohr–Sommerfeld–Wilson Quantization	297
14.5 Further Examples	301
15 Power Potentials	307
15.1 Introductory Remarks	307
15.2 The Power Potential	308
15.3 The Three-Dimensional Wave Function	315
16 Screened Coulomb Potentials	319
16.1 Introductory Remarks	319
16.2 Regge Trajectories	322
16.3 The S -Matrix	328
16.4 The Energy Expansion	329
16.5 The Sommerfeld–Watson Transform	330
16.6 Concluding Remarks	336
17 Periodic Potentials	339
17.1 Introductory Remarks	339
17.2 Cosine Potential: Weak Coupling Solutions	341
17.2.1 The Floquet exponent	341
17.2.2 Four types of periodic solutions	350
17.3 Cosine Potential: Strong Coupling Solutions	353
17.3.1 Preliminary remarks	353
17.3.2 The solutions	354

17.3.3	The eigenvalues	361
17.3.4	The level splitting	363
17.4	Elliptic and Ellipsoidal Potentials	371
17.4.1	Introduction	371
17.4.2	Solutions and eigenvalues	373
17.4.3	The level splitting	375
17.4.4	Reduction to Mathieu functions	377
17.5	Concluding Remarks	378
18	Anharmonic Oscillator Potentials	379
18.1	Introductory Remarks	379
18.2	The Inverted Double Well Potential	382
18.2.1	Defining the problem	382
18.2.2	Three pairs of solutions	384
18.2.3	Matching of solutions	391
18.2.4	Boundary conditions at the origin	393
18.2.5	Boundary conditions at infinity	396
18.2.6	The complex eigenvalues	402
18.3	The Double Well Potential	405
18.3.1	Defining the problem	405
18.3.2	Three pairs of solutions	407
18.3.3	Matching of solutions	412
18.3.4	Boundary conditions at the minima	414
18.3.5	Boundary conditions at the origin	417
18.3.6	Eigenvalues and level splitting	424
18.3.7	General Remarks	427
19	Singular Potentials	435
19.1	Introductory Remarks	435
19.2	The Potential $1/r^4$ — Case of Small h^2	436
19.2.1	Preliminary considerations	436
19.2.2	Small h^2 solutions in terms of Bessel functions	438
19.2.3	Small h^2 solutions in terms of hyperbolic functions	441
19.2.4	Notation and properties of solutions	442
19.2.5	Derivation of the S -matrix	446
19.2.6	Evaluation of the S -matrix	455
19.2.7	Calculation of the absorptivity	458
19.3	The Potential $1/r^4$ — Case of Large h^2	460
19.3.1	Preliminary remarks	460
19.3.2	The Floquet exponent for large h^2	461
19.3.3	Construction of large- h^2 solutions	464

19.3.4	The connection formulas	466
19.3.5	Derivation of the \mathbf{S} -matrix	468
19.4	Concluding Remarks	470
20	Large Order Behaviour of Perturbation Expansions	471
20.1	Introductory Remarks	471
20.2	Cosine Potential: Large Order Behaviour	476
20.3	Cosine Potential: Complex Eigenvalues	479
20.3.1	The decaying ground state	479
20.3.2	Decaying excited states	486
20.3.3	Relating the level splitting to imaginary E	493
20.3.4	Recalculation of large order behaviour	494
20.4	Cosine Potential: A Different Calculation	495
20.5	Anharmonic Oscillators	500
20.5.1	The inverted double well	500
20.5.2	The double well	501
20.6	General Remarks	502
21	The Path Integral Formalism	503
21.1	Introductory Remarks	503
21.2	Path Integrals and Green's Functions	504
21.3	The Green's Function for Potential $\mathbf{V}=\mathbf{0}$	510
21.3.1	Configuration space representation	510
21.3.2	Momentum space representation	513
21.4	Including \mathbf{V} in First Order Perturbation	514
21.5	Rederivation of the Rutherford Formula	518
21.6	Path Integrals in Dirac's Notation	524
21.7	Canonical Quantization from Path Integrals	533
22	Classical Field Configurations	537
22.1	Introductory Remarks	537
22.2	The Constant Classical Field	539
22.3	Soliton Theories in One Spatial Dimension	544
22.4	Stability of Classical Configurations	549
22.5	Bogomol'nyi Equations and Bounds	554
22.6	The Small Fluctuation Equation	557
22.7	Existence of Finite-Energy Solutions	564
22.8	Ginzburg–Landau Vortices	570
22.9	Introduction to Homotopy Classes	574
22.10	The Fundamental Homotopy Group	579

23 Path Integrals and Instantons	583
23.1 Introductory Remarks	583
23.2 Instantons and Anti-Instantons	583
23.3 The Level Difference	592
23.4 Field Fluctuations	596
23.4.1 The fluctuation equation	596
23.4.2 Evaluation of the functional integral	603
23.4.3 The Faddeev–Popov constraint insertion	609
23.4.4 The single instanton contribution	613
23.4.5 Instanton–anti-instanton contributions	614
23.5 Concluding Remarks	618
24 Path Integrals and Bounces on a Line	619
24.1 Introductory Remarks	619
24.2 The Bounce in a Simple Example	625
24.3 The Inverted Double Well: The Bounce and Complex Energy	631
24.3.1 The bounce solution	631
24.3.2 The single bounce contribution	635
24.3.3 Evaluation of the single bounce kernel	637
24.3.4 Sum over an infinite number of bounces	641
24.3.5 Comments	644
24.4 Inverted Double Well: Constant Solutions	644
24.5 The Cubic Potential and its Complex Energy	645
25 Periodic Classical Configurations	649
25.1 Introductory Remarks	649
25.2 The Double Well Theory on a Circle	650
25.2.1 Periodic configurations	650
25.2.2 The fluctuation equation	659
25.2.3 The limit of infinite period	663
25.3 The Inverted Double Well on a Circle	664
25.3.1 Periodic configurations	664
25.3.2 The fluctuation equation	667
25.3.3 The limit of infinite period	669
25.4 The Sine–Gordon Theory on a Circle	670
25.4.1 Periodic configurations	670
25.4.2 The fluctuation equation	671
25.5 Conclusions	673

26 Path Integrals and Periodic Classical Configurations	675
26.1 Introductory Remarks	675
26.2 The Double Well and Periodic Instantons	676
26.2.1 Periodic configurations and the double well	676
26.2.2 Transition amplitude and Feynman kernel	678
26.2.3 Fluctuations about the periodic instanton	679
26.2.4 The single periodic instanton contribution	684
26.2.5 Sum over instanton–anti-instanton pairs	688
26.3 The Cosine Potential and Periodic Instantons	690
26.3.1 Periodic configurations and the cosine potential	690
26.3.2 Transition amplitude and Feynman kernel	693
26.3.3 The fluctuation equation and its eigenmodes	694
26.3.4 The single periodic instanton contribution	696
26.3.5 Sum over instanton–anti-instanton pairs	700
26.4 The Inverted Double Well and Periodic Instantons	702
26.4.1 Periodic configurations and the inverted double well	702
26.4.2 Transition amplitude and Feynman kernel	705
26.4.3 The fluctuation equation and its eigenmodes	706
26.4.4 The single periodic bounce contribution	708
26.4.5 Summing over the infinite number of bounces	710
26.5 Concluding Remarks	714
27 Quantization of Systems with Constraints	715
27.1 Introductory Remarks	715
27.2 Constraints: How they arise	717
27.2.1 Singular Lagrangians	720
27.3 The Hamiltonian of Singular Systems	723
27.4 Persistence of Constraints in Course of Time	726
27.5 Constraints as Generators of a Gauge Group	727
27.6 Gauge Fixing and Dirac Quantization	734
27.7 The Formalism of Dirac Quantization	736
27.7.1 Poisson and Dirac brackets in field theory	740
27.8 Dirac Quantization of Free Electrodynamics	740
27.9 Faddeev–Jackiw Canonical Quantization	745
27.9.1 The method of Faddeev and Jackiw	745
28 The Quantum-Classical Crossover as Phase Transition	753
28.1 Introductory Remarks	753
28.2 Relating Period to Temperature	755
28.3 Crossover in Previous Cases	756
28.3.1 The double well and phase transitions	757

28.3.2 The cosine potential and phase transitions	759
28.4 Crossover in a Simple Spin Model	760
28.5 Concluding Remarks	771
29 Summarizing Remarks	773
A Properties of Jacobian Elliptic Functions	775
Bibliography	779
Index	797
