Preface to the 2nd Edition	xiii
Preface to the 1st Edition	xiv
1 Introduction	1
1.3 Motivation and overview	1
1.4 Direct-voltage accelerators	3
1.5 A review of relativistic particle motion	6
1.6 Linear accelerators with oscillating electric fields	9
1.7 Circular machines	12
1.8 Momentum compaction and the synchronous particle	14
Problems	16
2 Equations of Motion for Weak Focusing	20
2.1 Reference system for a circular machine	20
2.2 Equations of motion	20
2.3 Solutions of the motion equations and transfer matrices	23
2.4 Momentum dispersion	27
2.5 Weak focusing synchrotron	29
2.6 Momentum compaction factor	32
Problems	33
3 Mechanics of Trajectories	35
3.1 Liouville's theorem	35
3.2 General transformations	39
3.3 Canonical momentum and vector potential	40
3.4 Hamiltonian formalism and canonical coordinates	42
3.5 Symplectic transformations and matrices	45
3.6 The standard canonical coordinates	49
3.7 Symplectic generators	52
3.8 Symplectic integrators	57
3.8.1 Lie groups and algebras	61
3.8.2 Cayley transforms and symplectification	64
3.8.3 Integration by Cayley transform	67
3.8.4 Runge-Kutta-Munthe-Kas integration	69
Problems	70

4	Optical Elements with Static Magnetic Fields	76
4.1	Transverse fields and multipoles	77
4.2	Equipotential surfaces and pole face contours	79
4.3	Quadrupole lenses	82
4.4	End field effects in a dipole	83
4.5	Ideal solenoid with thin fringes	87
	Problems	91
5	Strong Focusing	96
5.1	Transfer matrix approach and stability of the linear system	97
5.2	Analytical approach	100
5.3	Emittances	104
5.4	Adiabatic invariants	107
5.5	Dispersion	108
5.6	Momentum compaction	110
	Problems	111
6	Lattice Exercises	115
6.1	The FODO lattice	115
6.2	Stability diagrams	116
6.3	FODO cell dispersion	117
6.4	A few explicit forms of the Twiss matrix	119
6.5	Insertions	121
6.6	Dispersion suppressors	122
6.7	Low beta insertion	125
6.8	Coupled motion	127
6.9	Finding the eigenvalues of a 4×4 transfer matrix	130
6.10	Chromaticity	134
	Problems	137
7	Synchrotron Oscillations	140
7.1	Transition energy	140
7.2	The phase stability principle	141
7.3	Resonant acceleration	142
7.4	The phase oscillation equation	144
7.5	Large oscillations	146
7.6	Hamiltonian formalism	149
7.7	Adiabatic invariant	155

7.8 Bunch manipulations	156
Problems	161
8 Synchrotron Radiation	164
8.1 Radiated power	164
8.2 Radiation damping of energy oscillations	167
8.3 Damping of the vertical oscillations	169
8.4 Damping of the horizontal oscillations	171
8.5 Damping partition numbers	174
8.6 Frequency spectrum of the radiation	175
8.7 Energy spread and bunch length	178
8.8 Transverse excitations	181
8.9 Beam lifetime considerations	183
Problems	185
9 RF Linear Accelerators	188
9.1 Maxwell's equations and waves	188
9.2 Cylindrical waveguides	191
9.3 Electron capture	196
9.4 Cylindrical cavities	198
9.5 Longitudinal equations of motion in a linac	204
9.6 Transverse defocusing	206
9.7 Radio frequency quadrupoles	208
Problems	211
10 Resonances	213
10.1 Integer resonances	213
10.2 Linear coupling resonances	215
10.2.1 Stability of difference resonance and instability of sum resonance	215
10.3 Assessment of resonances	217
10.4 Krylov-Bogoliubov method	221
10.5 Half-integer resonance	223
10.6 The nonlinear third-integer resonance	225
10.7 Recapitulation	228
Problems	229
11 Space-Charge Effects	231
11.1 Transverse effects: tune shift	231

11.2	Luminosity and collider rings	234
11.3	Transverse effects: beam-beam interaction	235
11.4	Longitudinal effects	238
12	How to Baffle Liouville	243
12.1	Beam temperatures	243
12.2	Electron cooling	246
12.3	Stochastic cooling	252
12.4	Center of mass of a system of oscillators	256
12.5	Noise	258
12.6	Mixing	260
	Problems	263
13	Spin Dynamics	265
13.1	Introduction	265
13.1.1	Simple nonrelativistic model of a spinning body	265
13.2	Magnetic moments of particles in the rest system	268
13.3	Basic Thomas precession	271
13.4	The Thomas-Frenkel-BMT equation	275
13.5	Covariant form of spin precession	279
13.5.1	Relativistic boost of a slowly spinning disk	279
13.5.2	Covariant formulation of the Thomas-Frenkel-BMT equation ...	282
13.6	Review of nonrelativistic quantum mechanics with emphasis on spin	284
13.6.1	Constructing Pauli-like matrices for higher spins	289
13.7	Rotation matrices for spinors	295
13.8	Spin precession on the closed orbit	297
13.9	Spin motion in the standard coordinate system	301
13.9.1	Sector bend magnets	303
13.9.2	Quadrupole magnets	304
13.10	Vertical betatron oscillations and intrinsic resonances	305
13.11	Froissart-Stora formula for a single resonance	308
13.12	Invariant spin field	311
13.13	Polarization of electron beams	313
	Problems	315
14	Position Measurements and Spectra	319
14.1	Transverse position measurement	319
14.2	Coherent and Schottky frequency spectra of beams	323

14.2.1 A single Gaussian bunch	323
14.2.2 Circulating bunches	324
14.2.3 Momentum spread	326
14.2.4 Longitudinal Schottky spectrum of an unbunched beam	327
14.2.5 Synchrotron oscillations of a single particle	328
14.2.6 Transverse Schottky spectrum of an unbunched beam	330
Problems	333
A Confusion of Definitions in Other Sources	335
A.1 Coordinates	335
A.2 Emittance	335
A.3 Tunes: Q or ν	336
A.4 Betatron functions	336
A.5 Dispersion function	336
A.6 Chromaticity	337
A.7 Momentum compaction	337
A.8 Multipole numbering	337
A.9 Phase slip	337
A.10 Longitudinal canonical momentum W	338
B Properties of a Generic Optical System	339
C Generating Functions	341
D Luminosity	344
D.1 Basic definition of luminosity	344
D.2 Gaussian beam distributions	346
D.3 Estimation of luminosities in RHIC	351
E Leapfrog Integration of Equations of Motion	356
F Some Useful Mathematical Formulae	358
Index	361
