<b>Preface</b>	<b>vii</b>
Notes and References . . . . .	xi
<b>1 Basics</b>	<b>1</b>
1.1 Galilean Invariance of Newtonian Mechanics . . . . .	1
1.1.1 Translations . . . . .	2
1.1.2 Rotations . . . . .	2
1.1.3 Galilei Boosts . . . . .	3
1.1.4 Galilei Group . . . . .	3
1.2 Lorentz Invariance of Maxwell Equations . . . . .	3
1.2.1 Lorentz Boosts . . . . .	4
1.2.2 Lorentz Group . . . . .	6
1.3 Infinitesimal Lorentz Transformations . . . . .	6
1.3.1 Generators of Group Transformations . . . . .	7
1.3.2 Group Multiplication and Lie Algebra . . . . .	9
1.4 Vector-, Tensor-, and Scalar Fields . . . . .	11
1.4.1 Discrete Lorentz Transformations . . . . .	14
1.4.2 Poincaré group . . . . .	14
1.5 Differential Operators for Lorentz Transformations . . . . .	15
1.6 Vector and Tensor Operators . . . . .	16
1.7 Behavior of Vectors and Tensors under Finite Lorentz Transformations	16
1.7.1 Rotations . . . . .	17
1.7.2 Lorentz Boosts . . . . .	18
1.7.3 Lorentz Group . . . . .	18
1.8 Relativistic Point Mechanics . . . . .	19
1.9 Quantum Mechanics . . . . .	22
1.10 Relativistic Particles in Electromagnetic Field . . . . .	24
1.11 Dirac Particles and Fields . . . . .	29
1.12 Energy-Momentum Tensor . . . . .	32
1.12.1 Point Particles . . . . .	32
1.12.2 Perfect Fluid . . . . .	34
1.12.3 Electromagnetic Field . . . . .	34
1.13 Angular Momentum and Spin . . . . .	36
1.14 Spacetime-Dependent Lorentz Transformations . . . . .	41
1.14.1 Angular Velocities . . . . .	41

1.14.2	Angular Gradients . . . . .	43
Appendix 1A	Tensor Identities . . . . .	43
1A.1	Product Formulas . . . . .	44
1A.2	Determinants . . . . .	46
1A.3	Expansion of Determinants . . . . .	46
Notes and References	. . . . .	46
<b>2</b>	<b>Action Approach</b>	<b>48</b>
2.1	General Particle Dynamics . . . . .	49
2.2	Single Relativistic Particle . . . . .	50
2.3	Scalar Fields . . . . .	52
2.3.1	Locality . . . . .	52
2.3.2	Lorentz Invariance . . . . .	53
2.3.3	Field Equations . . . . .	54
2.3.4	Plane Waves . . . . .	55
2.3.5	Schrödinger Quantum Mechanics as Nonrelativistic Limit . . . . .	55
2.3.6	Natural Units . . . . .	56
2.3.7	Hamiltonian Formalism . . . . .	57
2.3.8	Conserved Current . . . . .	58
2.4	Maxwell's Equation from Extremum of Field Action . . . . .	59
2.4.1	Electromagnetic Field Action . . . . .	60
2.4.2	Alternative Action for Electromagnetic Field . . . . .	61
2.4.3	Hamiltonian of Electromagnetic Fields . . . . .	61
2.4.4	Gauge Invariance of Maxwell's Theory . . . . .	63
2.5	Maxwell-Lorentz Action for Charged Point Particles . . . . .	65
2.6	Scalar Field with Electromagnetic Interaction . . . . .	66
2.7	Dirac Fields . . . . .	67
2.8	Quantization . . . . .	69
Notes and References	. . . . .	70
<b>3</b>	<b>Continuous Symmetries and Conservation Laws. Noether's Theorem</b>	<b>71</b>
3.1	Continuous Symmetries and Conservation Laws . . . . .	71
3.1.1	Group Structure of Symmetry Transformations . . . . .	71
3.1.2	Substantial Variations . . . . .	72
3.1.3	Conservation Laws . . . . .	72
3.1.4	Alternative Derivation of Conservation Laws . . . . .	73
3.2	Time Translation Invariance and Energy Conservation . . . . .	75
3.3	Momentum and Angular Momentum . . . . .	76
3.3.1	Translational Invariance in Space . . . . .	77
3.3.2	Rotational Invariance . . . . .	77
3.3.3	Center-of-Mass Theorem . . . . .	78
3.3.4	Conservation Laws from Lorentz Invariance . . . . .	80
3.4	Generating the Symmetries . . . . .	82

3.5	Field Theory . . . . .	84
3.5.1	Continuous Symmetry and Conserved Currents . . . . .	84
3.5.2	Alternative Derivation . . . . .	85
3.5.3	Local Symmetries . . . . .	86
3.6	Canonical Energy-Momentum Tensor . . . . .	88
3.6.1	Electromagnetism . . . . .	90
3.6.2	Dirac Field . . . . .	91
3.7	Angular Momentum . . . . .	92
3.8	Four-Dimensional Angular Momentum . . . . .	93
3.9	Spin Current . . . . .	95
3.9.1	Electromagnetic Fields . . . . .	95
3.9.2	Dirac Field . . . . .	98
3.10	Symmetric Energy-Momentum Tensor . . . . .	100
3.11	Internal Symmetries . . . . .	102
3.11.1	U(1)-Symmetry and Charge Conservation . . . . .	103
3.11.2	Broken Internal Symmetries . . . . .	103
3.12	Generating the Symmetry Transformations for Quantum Fields . . .	104
3.13	Energy-Momentum Tensor of Relativistic Massive Point Particle . .	105
3.14	Energy-Momentum Tensor of Massive Charged Particle in Electro- magnetic Field . . . . .	107
	Notes and References . . . . .	110
<b>4</b>	<b>Multivalued Gauge Transformations in Magnetostatics</b>	<b>111</b>
4.1	Vector Potential of Current Distribution . . . . .	111
4.2	Multivalued Gradient Representation of Magnetic Field . . . . .	112
4.3	Generating Magnetic Fields by Multivalued Gauge Transformations	119
4.4	Magnetic Monopoles . . . . .	120
4.5	Minimal Magnetic Coupling of Particles from Multivalued Gauge Transformations . . . . .	123
4.6	Equivalence of Multivalued Scalar and Singlevalued Vector Fields . .	125
4.7	Multivalued Field Theory of Magnetic Monopoles and Electric Cur- rents . . . . .	127
	Notes and References . . . . .	129
<b>5</b>	<b>Multivalued Fields in Superfluids and Superconductors</b>	<b>131</b>
5.1	Superfluid Transition . . . . .	131
5.1.1	Configuration Entropy . . . . .	133
5.1.2	Origin of Massless Excitations . . . . .	134
5.1.3	Vortex Density . . . . .	138
5.1.4	Partition Function . . . . .	138
5.1.5	Continuum Derivation of Interaction Energy . . . . .	144
5.1.6	Physical Jumping Surfaces . . . . .	145
5.1.7	Canonical Representation of Superfluid . . . . .	146
5.1.8	Yukawa Loop Gas . . . . .	150

5.1.9	Gauge Field of Superflow . . . . .	151
5.1.10	Disorder Field Theory . . . . .	153
5.2	Phase Transition in Superconductor . . . . .	156
5.2.1	Ginzburg-Landau Theory . . . . .	158
5.2.2	Disorder Theory of Superconductor . . . . .	160
5.3	Order versus Disorder Parameter . . . . .	163
5.3.1	Superfluid $^4\text{He}$ . . . . .	163
5.3.2	Superconductor . . . . .	168
5.4	Order of Superconducting Phase Transition and Tricritical Point . .	174
5.4.1	Fluctuation Regime . . . . .	174
5.4.2	First- or Second-Order Transition? . . . . .	175
5.4.3	Partition Function of Superconductor with Vortex Lines . .	176
5.4.4	First-Order Regime . . . . .	177
5.4.5	Vortex Line Origin of Second-Order Transition . . . . .	179
5.4.6	Tricritical Point . . . . .	180
5.4.7	Disorder Theory . . . . .	181
5.5	Vortex Lattices . . . . .	182
	Appendix 5A Single Vortex Line in Superfluid . . . . .	183
	Notes and References . . . . .	189
<b>6</b>	<b>Dynamics of Superfluids</b>	<b>196</b>
6.1	Hydrodynamic Description of Superfluid . . . . .	196
6.2	Velocity of Second Sound . . . . .	201
6.3	Vortex-Electromagnetic Fields . . . . .	202
6.4	Simple Example . . . . .	203
6.5	Eckart Theory of Ideal Quantum Fluids . . . . .	206
6.6	Rotating Superfluid . . . . .	207
	Notes and References . . . . .	208
<b>7</b>	<b>Dynamics of Charged Superfluid and Superconductor</b>	<b>210</b>
7.1	Hydrodynamic Description of Charged Superfluid . . . . .	211
7.2	London Theory of Charged Superfluid . . . . .	212
7.3	Including Vortices in London Equations . . . . .	214
7.4	Hydrodynamic Description of Superconductor . . . . .	215
	Appendix 7A Excitation Spectrum of Superconductor . . . . .	219
7A.1	Gap Equation . . . . .	219
7A.2	Action of Quadratic Fluctuations . . . . .	223
7A.3	Long-Wavelength Excitations at Zero Temperature . . . . .	225
7A.4	Long-Wavelength Excitations at Nonzero Temperature . . .	227
7A.5	Bending Energies of Order Field . . . . .	229
7A.6	Kinetic Terms of Pair Field at Nonzero Temperature . . . .	232
	Appendix 7B Properties of Ginzburg-Landau Theory of Superconductivity	237
7B.1	Critical Magnetic Field . . . . .	239
7B.2	Two Length Scales and Type I or II Superconductivity . . .	240

7B.3	Single Vortex Line and Critical Field $H_{c_1}$ . . . . .	243
7B.4	Critical Field $H_{c_2}$ where Superconductivity is Destroyed . . . . .	248
	Notes and References . . . . .	250
<b>8</b>	<b>Relativistic Magnetic Monopoles and Electric Charge Confinement</b>	<b>251</b>
8.1	Monopole Gauge Invariance . . . . .	251
8.2	Charge Quantization . . . . .	256
8.3	Electric and Magnetic Current-Current Interactions . . . . .	258
8.4	Dual Gauge Field Representation . . . . .	259
8.5	Monopole Gauge Fixing . . . . .	261
8.6	Quantum Field Theory of Spinless Electric Charges . . . . .	262
8.7	Theory of Magnetic Charge Confinement . . . . .	263
8.8	Second Quantization of the Monopole Field . . . . .	265
8.9	Quantum Field Theory of Electric Charge Confinement . . . . .	267
	Notes and References . . . . .	270
<b>9</b>	<b>Multivalued Mapping from Ideal Crystals to Crystals with Defects</b>	<b>274</b>
9.1	Defects . . . . .	274
9.2	Dislocation Lines and Burgers Vector . . . . .	278
9.3	Disclination Lines and Frank Vector . . . . .	281
9.4	Interdependence of Dislocation and Disclinations . . . . .	283
9.5	Defect Lines with Infinitesimal Discontinuities in Continuous Media . . . . .	284
9.6	Multivaluedness of Displacement Field . . . . .	286
9.7	Smoothness Properties of Displacement Field and Weingarten's Theorem . . . . .	287
9.8	Integrability Properties of Displacement Field . . . . .	290
9.9	Dislocation and Disclination Densities . . . . .	292
9.10	Mnemonic Procedure for Constructing Defect Densities . . . . .	295
9.11	Defect Gauge Invariance . . . . .	297
9.12	Branching Defect Lines . . . . .	299
9.13	Defect Density and Incompatibility . . . . .	300
	Notes and References . . . . .	305
<b>10</b>	<b>Defect Melting</b>	<b>307</b>
10.1	Specific Heat . . . . .	307
10.2	Elastic Energy of Solid with Defects . . . . .	308
	Notes and References . . . . .	314
<b>11</b>	<b>Relativistic Mechanics in Curvilinear Coordinates</b>	<b>316</b>
11.1	Equivalence Principle . . . . .	316
11.2	Free Particle in General Coordinates Frame . . . . .	317
11.3	Minkowski Geometry formulated in General Coordinates . . . . .	320
11.3.1	Local Basis tetrads . . . . .	321
11.3.2	Vector- and Tensor Fields in Minkowski Coordinates . . . . .	323

11.3.3	Vector- and Tensor Fields in General Coordinates . . . . .	324
11.3.4	Affine Connections and Covariant Derivatives . . . . .	327
11.4	Torsion tensor . . . . .	329
11.5	Covariant Time Derivative and Acceleration . . . . .	331
11.6	Curvature Tensor as Covariant Curl of Affine Connection . . . . .	331
11.7	Riemann Curvature Tensor . . . . .	335
	Appendix 11A Curvilinear Versions of Levi-Civita Tensor . . . . .	337
	Notes and References . . . . .	340
<b>12</b>	<b>Torsion and Curvature from Defects</b>	<b>342</b>
12.1	Multivalued Infinitesimal Coordinate Transformations . . . . .	343
12.2	Examples for Nonholonomic Coordinate Transformations . . . . .	348
12.2.1	Dislocation . . . . .	348
12.2.2	Disclination . . . . .	350
12.3	Differential-Geometric Properties of Affine Spaces . . . . .	350
12.3.1	Integrability of Metric and Affine Connection . . . . .	351
12.3.2	Local Parallelism . . . . .	352
12.4	Circuit Integrals in Affine Spaces with Curvature and Torsion . . . . .	355
12.4.1	Closed-Contour Integral over Parallel Vector Field . . . . .	355
12.4.2	Closed-Contour Integral over Coordinates . . . . .	356
12.4.3	Closure Failure and Burgers Vector . . . . .	357
12.4.4	Alternative Circuit Integral for Curvature . . . . .	357
12.4.5	Parallelism in World Crystal . . . . .	358
12.5	Bianchi Identities for Curvature and Torsion Tensors . . . . .	359
12.6	Special Coordinates in Riemann Spacetime . . . . .	361
12.6.1	Geodesic Coordinates . . . . .	361
12.6.2	Canonical Geodesic Coordinates . . . . .	363
12.6.3	Harmonic Coordinates . . . . .	365
12.6.4	Coordinates with $\det(g_{\mu\nu}) = 1$ . . . . .	367
12.6.5	Orthogonal Coordinates . . . . .	367
12.7	Number of Independent Components of $R_{\mu\nu\lambda}{}^{\kappa}$ and $S_{\mu\nu}{}^{\lambda}$ . . . . .	369
12.7.1	Two Dimensions . . . . .	369
12.7.2	Three Dimensions . . . . .	371
12.7.3	Four or More Dimensions . . . . .	371
	Notes and References . . . . .	373
<b>13</b>	<b>Curvature and Torsion from Embedding</b>	<b>374</b>
13.1	Spacetimes with Constant Curvature . . . . .	374
13.2	Basis Vectors . . . . .	375
13.3	Torsion . . . . .	379
	Notes and References . . . . .	379

<b>14 Multivalued Mapping Principle</b>	<b>380</b>
14.1 Motion of Point Particle . . . . .	381
14.1.1 Classical Action Principle for Spaces with Curvature . . . . .	381
14.1.2 Autoparallel Trajectories in Spaces with Torsion . . . . .	381
14.1.3 Equations of Motion For Spin . . . . .	387
14.1.4 Special Properties of Gradient Torsion . . . . .	387
14.2 Autoparallel Trajectories from Embedding . . . . .	388
14.2.1 Special Role of Autoparallels . . . . .	388
14.2.2 Gauss Principle of Least Constraint . . . . .	389
14.3 Maxwell-Lorentz Orbits as Autoparallel Trajectories . . . . .	390
14.4 Bargmann-Michel-Telegdi Equation from Torsion . . . . .	391
Notes and References . . . . .	391
<b>15 Field Equations of Gravitation</b>	<b>393</b>
15.1 Invariant Action . . . . .	393
15.2 Energy-Momentum Tensor and Spin Density . . . . .	396
15.3 Symmetric Energy-Momentum Tensor and Defect Density . . . . .	401
Notes and References . . . . .	403
<b>16 Minimally Coupled Fields of Integer Spin</b>	<b>404</b>
16.1 Scalar Fields in Riemann-Cartan Space . . . . .	404
16.2 Electromagnetism in Riemann-Cartan Space . . . . .	406
Notes and References . . . . .	409
<b>17 Particles with Half-Integer Spin</b>	<b>410</b>
17.1 Local Lorentz Invariance and Anholonomic Coordinates . . . . .	410
17.1.1 Nonholonomic Image of Dirac Action . . . . .	410
17.1.2 Vierbein Fields . . . . .	413
17.1.3 Local Inertial Frames . . . . .	414
17.1.4 Difference between Vierbein and Multivalued Tetrad Fields . . . . .	416
17.1.5 Covariant Derivatives in Intermediate Basis . . . . .	417
17.2 Dirac Action in Riemann-Cartan Space . . . . .	420
17.3 Ricci Identity . . . . .	422
17.4 Alternative Form of Coupling . . . . .	422
17.5 Invariant Action for Vector Fields . . . . .	423
17.6 Verifying Local Lorentz Invariance . . . . .	426
17.7 Field Equations with Spinning Matter . . . . .	427
Notes and References . . . . .	431
<b>18 Covariant Conservation Law</b>	<b>432</b>
18.1 Spin Density . . . . .	432
18.2 Energy-Momentum Density . . . . .	434
18.3 Covariant Derivation of Conservation Laws . . . . .	437
18.4 Matter with Integer Spin . . . . .	438
18.5 Relations between Conservation Laws and Bianchi Identities . . . . .	440

18.6	Particle Trajectories from Energy-Momentum Conservation . . . . .	442
	Notes and References . . . . .	443
<b>19</b>	<b>Gravitation of Spinning Matter as a Gauge Theory</b>	<b>444</b>
19.1	Local Lorentz Transformations . . . . .	444
19.2	Local Translations . . . . .	446
	Notes and References . . . . .	447
<b>20</b>	<b>Evanescent Properties of Torsion in Gravity</b>	<b>448</b>
20.1	Local Four-Fermion Interaction due to Torsion . . . . .	448
20.2	No Need for Torsion in Gravity . . . . .	451
20.3	Scalar Fields . . . . .	453
20.3.1	Only Spin-1/2 Sources . . . . .	453
20.4	Modified Energy-Momentum Conservation Law . . . . .	455
20.4.1	Solution for Gradient Torsion . . . . .	456
20.4.2	Gradient Torsion coupled to Scalar Fields . . . . .	457
20.4.3	New Scalar Product . . . . .	458
20.4.4	Self-Interacting Higgs Field . . . . .	459
20.5	Summary . . . . .	459
	Notes and References . . . . .	460
<b>21</b>	<b>Teleparallel Theory of Gravitation</b>	<b>463</b>
21.1	Torsion Form of Einstein Action . . . . .	463
21.2	Schwarzschild Solution . . . . .	469
	Notes and References . . . . .	473
<b>22</b>	<b>Emerging Gravity</b>	<b>474</b>
22.1	Gravity in the World Crystal . . . . .	474
22.2	Gravity Emerging from Fluctuations of Matter and Radiation . . . . .	478
	Notes and References . . . . .	480
	<b>Index</b>	<b>481</b>
