<i>Preface</i>	vii
Part I — General Principles	1
1. Elements of Thermodynamics	3
1.1 Kinematical aspects of thermal physics	4
1.2 Dynamical aspects of thermal physics	6
1.3 Equations of state	7
1.4 The meaning of intensive variables	9
1.5 Thermodynamical potentials	12
1.6 Gibbs-Duhem relation	15
1.7 Second derivatives	16
1.8 Example: ideal gas and generalizations	19
1.8.1 State equation for an ideal gas	19
1.8.2 The van der Waals equation	20
1.9 Stability conditions and phase transitions	21
2. Elements of Statistical Mechanics	27
2.1 Macro- and micro-physics	27
2.2 Liouville-von Neumann equation	29
2.3 Gibbs ensembles	31
2.3.1 Micro-canonical ensemble	31
2.3.2 Canonical ensemble	32
2.3.3 Grand-canonical ensemble	33
2.3.4 Equivalence among the ensembles	34
2.4 Wigner function formalism	35
3. Partition Function and Path Integral	39
3.1 Partition function and the propagator	39

- 3.2 Path integral in quantum mechanics 42
- 3.3 Classical fields 43
- 3.4 Canonical quantization of scalar fields 46
- 3.5 Path integral for a scalar field 48
- 3.6 Canonical quantization of the Dirac field 51
- 3.7 Path integral for the Dirac field 55

- 4. Zero Temperature Interacting Fields 59
 - 4.1 Generating functional for bosons 59
 - 4.1.1 Feynman rules in momentum space 62
 - 4.2 The effective action 63
 - 4.3 Gauge fields 66
 - 4.4 Generating functional for gauge fields 70
 - 4.5 $U(1)$ gauge theory 73
 - 4.6 $SU(3)$ gauge theory 74
 - 4.7 Scattering amplitudes 77
 - 4.8 S -matrix in the canonical approach 85

Part II — Thermal Fields 87

- 5. Thermofield Dynamics: Kinematical Symmetry Algebraic Basis 89
 - 5.1 Thermal Hilbert space 91
 - 5.2 The meaning of the doubling: thermo-algebras 93
 - 5.2.1 Generators of symmetry and observables 93
 - 5.2.2 Doubled Lie algebra 94
 - 5.2.3 Tilde conjugation rules 96
 - 5.3 Tilde and non-tilde operators 97
 - 5.4 Liouville-von Neumann equation 100
 - 5.5 Physical implications of thermo-algebras 102

- 6. Thermal Oscillators: Bosons and Fermions 105
 - 6.1 Boson oscillators 105
 - 6.1.1 Thermal vacuum 106
 - 6.1.2 Bogoliubov transformation 107
 - 6.1.3 Thermal operators 108
 - 6.1.4 Matrix notation 111
 - 6.2 Fermion oscillators 112
 - 6.2.1 Thermal vacuum 112
 - 6.2.2 Bogoliubov transformation 113
 - 6.2.3 Thermal operators 114
 - 6.2.4 Matrix notation 115

6.3	TFD and spin 1/2 lattices	116
6.3.1	Boson representation for the $SU(2)$ algebra	117
6.3.2	Thermo- $SU(2)$ algebra	118
7.	Thermal Poincaré and Galilei Groups	121
7.1	The Poincaré group	121
7.2	Relativistic density matrices	122
7.2.1	Bosons	124
7.2.2	Fermions	125
7.3	The Galilei group	126
7.4	Galilean density matrices	128
7.5	Lagrangians	131
8.	Thermal Propagator	133
8.1	Thermal Klein-Gordon field	133
8.2	Thermal Dirac field	139
8.3	Doubled notation for bosons	142
8.4	Generating functional for bosons	143
8.5	Generating functional for fermions	145
8.6	Thermal gauge fields	146
9.	Scattering Process at Finite Temperature	149
9.1	Scattering matrix in TFD	150
9.2	Reaction rates	152
9.3	Decay of particles and generalized Cutkosky rules	153
9.4	Decay of Higgs meson	156
9.5	The detailed balance	157
9.6	Scattering cross-section of $1 + 2 \rightarrow 1' + 2'$	158
9.6.1	Boson-boson scattering	158
9.6.2	Fermion-fermion scattering	158
9.7	Fermion-boson scattering	159
10.	Topics on Renormalization Theory	161
10.1	Ultraviolet divergences	161
10.2	Regularization	164
10.3	Renormalization	165
10.3.1	Renormalization parts in the $\lambda\phi^4$ theory	171
10.3.2	The Callan-Zimanzik equation	172
10.4	Bogoliubov recurrence	173
10.4.1	Dimensional renormalization	175
10.4.2	Other renormalization procedures	177
10.4.3	Borel summability	179

- 10.5 Temperature effects 179
- 11. Ward-Takahashi Relations and Gauge Symmetry 183
 - 11.1 Ward relation 184
 - 11.2 Ward-Takahashi relations 184
 - 11.3 Applications of generalized Ward-Takahashi relations 186
 - 11.3.1 W-T relations for the case of n -body current amplitudes 186
 - 11.3.2 Ward-Takahashi relations at finite temperature 188
 - 11.4 Transverse Ward-Takahashi relations 191
 - 11.5 Transverse W-T relation in momentum space 194
 - 11.5.1 Full vertex for the fermion-gauge boson vertex 195
 - 11.5.2 Tranverse W-T relation for axial current 196
 - 11.5.3 Transverse W-T relation at finite temperature 196
 - 11.6 W-T relations and spontaneous symmetry breaking 196

Part III — Applications to Quantum Optics 199

- 12. Thermalized States of a Field Mode 201
 - 12.1 Thermalized states 201
 - 12.1.1 Thermal number states 202
 - 12.1.2 Thermal coherent states 202
 - 12.1.3 Thermal displaced number states 204
 - 12.1.4 Thermal squeezed states 205
 - 12.2 Physical interpretation 207
 - 12.3 Other possibilities of thermalized states 213
 - 12.3.1 Thermal tilde states 213
 - 12.3.2 Physical meaning of the thermal tilde states 215
 - 12.3.3 General states of \mathcal{H}_T 217
- 13. Nonclassical Properties of Thermal Quantum States 221
 - 13.1 Photon statistics 221
 - 13.1.1 Thermal states 222
 - 13.1.2 Thermal tilde states 227
 - 13.2 Quadrature squeezing 228
 - 13.3 Atomic population inversion 231
 - 13.4 Phase space representation 237
 - 13.4.1 Q -function of the thermal number state 238
 - 13.4.2 Wigner function of the thermal number state 239
 - 13.4.3 R -representation and nonclassical depth of the thermal number state 240

13.4.4	Phase space representations of the thermal tilde number state	241
14.	$SU(2)$ and $SU(1, 1)$ Systems: Entanglement	245
14.1	Maximum entanglement	245
14.2	Maximally entangled states and $SU(1, 1)$ symmetry	247
14.3	Maximally entangled states and $SU(2)$ symmetry	249
14.4	Entanglement of a system with fixed spin	250
14.5	Entanglement of two-boson squeezed states	252
14.6	Coherent fermion states and density matrix operators	255
14.7	Entanglement of two-mode squeezed fermion states	258

Part IV — Compactified Fields 261

15.	Compactified Fields	263
15.1	Compactification and topology	264
15.1.1	Compactification of one space dimension	264
15.1.2	Compactification of time dimension	268
15.1.3	Compactification of space and time	269
15.1.4	Compactification in d -dimensions	271
15.2	Generalized Bogoliubov transformation	272
15.3	Field theory	274
15.4	Feynman rules	277
16.	Casimir Effect for the Electromagnetic Field	279
16.1	The vacuum state of the electromagnetic field	280
16.2	The Casimir effect	287
16.2.1	Casimir effect at zero temperature	287
16.2.2	Casimir effect at non-zero temperature	288
16.3	Casimir-Boyer model	290
17.	Casimir Effect for Fermions	293
17.1	Casimir effect in Γ_4^1	294
17.2	Compactification in higher dimensions	296
17.3	Casimir effect for two plates	298
17.4	Casimir effect for a waveguide	299
17.5	Casimir effect for a box	303
17.6	Casimir effect for a non-interacting massless QCD	306
18.	Compactified $\lambda\varphi^4$ Theory	311
18.1	Compactification of a d -dimensional subspace	311

- 18.2 Subtraction scheme 314
- 18.3 The zero-temperature compactified model 317
 - 18.3.1 Wick-ordered model 317
 - 18.3.2 The model without Wick-ordering 317
- 18.4 The compactified model at finite temperature: spontaneous symmetry breaking 322
 - 18.4.1 Mass behavior and critical curve 323

- 19. Phase Transitions in Confined Systems: Application to Superconducting Films 327
 - 19.1 Overview 327
 - 19.2 Second-order phase transition in superconducting films 329
 - 19.2.1 The effective potential for the Ginzburg-Landau model with one compactified dimension 330
 - 19.3 Mass renormalization and transition temperature 333
 - 19.3.1 Effect of the coupling-constant correction on $T_c(L)$ 334
 - 19.4 Critical behavior of type-II superconducting films in a magnetic field 337
 - 19.4.1 Coupling-constant correction in the presence of an external magnetic field 337
 - 19.4.2 The gap equation and the critical curve 339

- 20. Second-Order Phase Transition in Wires and Grains 343
 - 20.1 Compactification of a d -dimensional subspace 343
 - 20.2 Critical behavior for wires 346
 - 20.3 Critical behavior for grains 349
 - 20.4 Boundary effects on the coupling constant 352
 - 20.5 Effects of the boundary-corrected coupling constant on the critical behavior 353
 - 20.5.1 Effects of the boundary-corrected coupling constant on the phase transition for wires 356
 - 20.5.2 Effects of the boundary-corrected coupling constant on the phase transition for grains 358
 - 20.6 Universal behavior of size-effects in second-order phase transitions 361

- 21. First-Order Phase Transitions in Confined Systems 365
 - 21.1 Effective potential with compactification of a d -dimensional subspace 365
 - 21.2 The film, the wire and the grain 371

Part V — Applications to Open Systems	375
22. Thermo-Algebras in Phase Space: Quantum and Classical Systems	377
22.1 Wigner function for the Schrödinger field	377
22.2 Wigner function for the Klein-Gordon field	381
22.3 Wigner function for the Dirac field	383
22.4 Representations for classical systems	385
22.4.1 Thermo-Lie groups for classical systems	385
22.4.2 $SU(1, 1)$ and the thermal classical oscillator	387
22.5 Classical unitary representations	389
22.6 Liouville equation for the oscillator	394
22.7 Non-relativistic symmetries in the Schönberg-Fock space	396
22.8 Classical relativistic representation	398
22.9 Boltzmann equation and non-relativistic limit	401
23. Real-Time Method for Nonequilibrium Quantum Mechanics	403
23.1 Schrödinger, Heisenberg and Liouville pictures	404
23.2 Linear model for phase transition	406
23.3 Nonlinear model for phase transition	408
23.3.1 Correlation functions in coherent state	409
23.3.2 Correlation functions in thermal state	411
23.4 Beyond the Hartree approximation for nonlinear model	412
23.4.1 Beyond the Hartree approximation	413
23.4.2 Stability of the Liouville-von Neumann method	415
23.5 TFD for time-dependent boson system	416
24. Dressed and Bare State Approaches to the Thermalization Process	421
24.1 The model	422
24.2 The thermalization process in bare coordinates	425
24.3 Dressed coordinates and dressed states	431
24.4 Thermal behavior for a cavity of arbitrary size with dressed coordinates	433
24.5 The limit of arbitrarily large cavity: unbounded space	435
<i>Epilogue</i>	441
<i>Bibliography</i>	445
<i>Index</i>	457
