Preface	v
Introduction	xi
1. Constructive Modeling of Free Developed Turbulence — Coherent Structures, Laminar–Turbulent Transition, Chaos	1
1.1. Introduction	1
1.2. Rational averaging of large vortex structures	12
1.3. Some experimental and theoretical investigations	29
1.4. General problem formulation	38
1.5. Simulation of coherent structures in turbulent flows	41
1.6. Correctness of the problem formulation	50
1.7. Calculated results for coherent structures in the wake behind a body	53
1.8. On the analysis of spectral characteristics	60
1.9. Numerical simulation of the random component of turbulence	71
1.10. Laminar–turbulent transition. Simulation of three-dimensional flows in clean rooms	76
1.11. Transition to chaos (numerical experiments)	84
1.11.1. General aspects	84
1.11.2. “Kolmogoroff’s flow” of the viscous fluid at subcritical and supercritical regimes. Transition to chaos	86
1.11.3. Study of the large-scale turbulence in ocean	111
1.11.4. Numerical simulation of the internal waves in a stratified fluid	128
1.11.5. Rayleigh–Taylor instability: evolution to the turbulent stage	137

1.11.6.	Numerical simulation of the convective flow over large-scale source of energy (big fire in the atmosphere)	143
1.12.	Axiomatic model of fully developed turbulence	152
1.13.	Conclusion	154
	Acknowledgement	157
	References	157
2.	Modeling of Richtmyer–Meshkov Instability	164
	Introduction	164
2.1.	Numerical method	169
2.2.	Model calculations	171
2.2.1.	The Cauchy problem for one-dimensional isotopic flow of an ideal gas	174
2.2.2.	Boundary conditions	176
2.2.3.	Comparison of results by different models	178
2.3.	The analytical approach	181
2.4.	Computational experiment	186
2.5.	Physical mechanisms of the RMI evolution	190
2.6.	A sequential transition to turbulence in RMI instability	198
2.7.	Three-dimensional numerical simulation of the RMI	200
2.8.	Conclusion	208
	Appendix	209
	References	210
3.	Rayleigh–Taylor Instability: Analysis and Numerical Simulation	214
3.1.	The theory of Rayleigh–Taylor instability: modulatory perturbations and mushroom-flow dynamics	214
3.1.1.	Introduction	215
3.1.2.	Periodicity and symmetry of modulatory perturbations	216
3.1.3.	Cutting off the singularities associated with jets	220
3.1.4.	Classification of perturbations	223
3.1.5.	Results	227
3.1.6.	Classification of stability problems	230
3.1.7.	Initiation of a mushroom structure	232
3.1.8.	The mushroom flow structure	238
3.1.9.	Numerical simulation	243

3.2.	Development of the Rayleigh–Taylor instability:	
	numerical simulations	246
3.2.1.	Introduction	246
3.2.2.	Numerical simulation of RTI development by the method of large particles	247
3.2.3.	Intermode interaction in RTI	252
3.2.4.	RTI simulation by the method of pseudo-compressibility	257
3.2.5.	Numerical simulation of the RTI development by means of high-resolution Euler hydrocode	262
	References	280
4.	Direct Statistical Approach for Aerohydrodynamic Problems	285
4.1.	Statistical modeling in rarefied gas-dynamics	285
4.1.1.	Introduction	285
4.1.2.	Stochastic analogue of the Boltzmann equation	287
4.1.3.	Probabilistic approach to the basic equation of the collision stage	291
4.1.4.	Algorithms for modeling the collision relaxation	294
4.2.	Direct statistical modeling of the shock wave in gaseous flow with velocity pulsations	299
4.2.1.	Introduction	299
4.2.2.	Problem formulation	300
4.2.3.	Results of the numerical modeling	303
4.2.4.	Conclusion	307
4.3.	Direct statistical simulation for some problems of turbulence	307
4.3.1.	Introduction	307
4.3.2.	An application of the statistical method of particles in cell for simulation of the momentumless wake	308
4.3.3.	An application of the statistical method of particles in cell to the problem of a turbulent spot	311
4.3.4.	The direct statistical modeling of the turbulence within a wake behind the cylinder	320
4.3.5.	Simulation results	330
4.3.6.	Conclusion	331
	References	333

Appendix A	Computational Experiment: Direct Numerical Simulation of Complex Gas-Dynamical Flows on the Basis of Euler, Navier–Stokes, and Boltzmann Models	336
A.1.	Introduction	336
A.1.1.	The use of numerical methods	336
A.1.2.	Numerical methods applicable to gas-dynamical problems	339
A.1.2.1.	Method of finite differences	340
A.1.2.2.	Method of integral relations	340
A.1.2.3.	Method of characteristics	341
A.1.2.4.	Particle-in-cell (PIC) method	341
A.1.3.	Development of numerical algorithms	342
A.1.3.1.	Steady-state schemes	342
A.1.3.2.	Unsteady-state schemes	344
A.1.3.3.	Large-particle method	344
A.1.4.	Computational experiments	345
A.2.	“Large-particles” method for the study of complex gas flows	347
A.2.1.	Calculations	347
A.2.2.	Boundary conditions	349
A.2.3.	Viscosity effects	350
A.2.4.	Stability of the scheme	352
A.2.5.	Advantages	354
A.2.6.	Results	355
A.3.	Computation of incompressible viscous flows	363
A.3.1.	The problem	363
A.3.2.	The difference scheme	364
A.3.3.	Results	367
A.4.	Computation of viscous compressible gas flow (conservative flow method)	369
A.4.1.	The method	369
A.4.2.	Analysis	372
A.4.3.	Results	374
A.5.	Statistical model for the investigation of rarefied gas flows	376
A.5.1.	The model	376
A.5.2.	The method	378
A.5.3.	Results	383

A.6. Conclusion	386
References	386
Appendix B Formation of Large-Scale Structures in the Gap Between Rotating Cylinders: the Rayleigh–Zeldovich Problem	389
B.1. Introduction	389
B.2. Background	391
B.3. Direct numerical simulation methodology	392
B.4. Statement of the problem and results	393
B.4.1. The inner cylinder is at rest and the outer cylinder is rotating	394
B.4.2. The inner cylinder is at rest and the outer cylinder is brought to rest	398
B.4.3. The inner cylinder is rotating and the outer cylinder is at rest	400
B.5. Conclusions	403
References	404
Appendix C Universal Technology of Parallel Computations for the Problems Described by Systems of the Equations of Hyperbolic Type: A Step to Supersolver	405
C.1. Introduction	405
C.2. Unified methodics	406
C.3. A method for using non-conservative variables	410
C.4. Parallel program implementation	413
C.5. Results of numerical simulation	415
C.6. Conclusion	418
References	420
Appendix D Supercomputers in Mathematical Modeling of the High Complexity Problems	422
D.1. Introduction	422
D.2. Turbulence and hydrodynamic instabilities	424
D.3. Supersolver	428
D.4. Applications	429
D.4.1. Gas-dynamics (CFD)	429
D.4.2. Hydrodynamic instabilities	434

D.4.3.	Seismic data processing	436
D.4.4.	Safety of housing and industrial constructions under intensive dynamic loadings	437
D.4.5.	Nonlinear contact shell dynamics	439
D.4.6.	Computer models in medicine	440
D.5.	Conclusion	444
	References	445
Appendix E	On Nuts and Bolts of Structural Turbulence and Hydrodynamic Instabilities	448
E.1.	Rational Constructivism	448
E.2.	Back in Mechanics	449
E.3.	Large Vortices	450
E.4.	Structural Instabilities	452
E.5.	Vortex Cascades	453
E.6.	Principal Modes	453
	References	456
Appendix F	List of the Main Publications of O. M. Belotserkovskii	459
	Monographs	459
	Papers	460
