<i>Preface</i>	vii
1. Introduction	1
1.1 General Introduction	1
1.2 Well-Posedness and Ill-Posedness	2
1.2.1 Examples of well-posed equations	3
1.2.2 Examples of ill-posed equations	4
1.3 What Do We Do in This Book?	4
2. Basic Results from Functional Analysis	7
2.1 Spaces and Operators	7
2.1.1 Spaces	7
2.1.2 Bounded operators	14
2.1.3 Compact operators	21
2.2 Some Important Theorems	29
2.2.1 Uniform boundedness principle	29
2.2.2 Closed graph theorem	34
2.2.3 Hahn-Banach theorem	36
2.2.4 Projection and Riesz representation theorems	38
2.3 Spectral Results for Operators	42
2.3.1 Invertibility of operators	42
2.3.2 Spectral notions	44
2.3.3 Spectrum of a compact operator	48
2.3.4 Spectral Mapping Theorem	49
2.3.5 Spectral representation for compact self adjoint operators	50

2.3.6	Singular value representation	51
2.3.7	Spectral theorem for self adjoint operators	53
	Problems	54
3.	Well-Posed Equations and Their Approximations	57
3.1	Introduction	57
3.2	Convergence and Error Estimates	60
3.3	Conditions for Stability	65
3.3.1	Norm approximation	66
3.3.2	Norm-square approximation	70
3.4	Projection Based Approximation	71
3.4.1	Interpolatory projections	71
3.4.2	A projection based approximation	74
3.5	Quadrature Based Approximation	76
3.5.1	Quadrature rule	77
3.5.2	Interpolatory quadrature rule	78
3.5.3	Nyström approximation	79
3.5.4	Collectively compact approximation	82
3.6	Norm-square Approximation Revisited	84
3.7	Second Kind Equations	88
3.7.1	Iterated versions of approximations	89
3.8	Methods for Second Kind Equations	90
3.8.1	Projection methods	91
3.8.2	Computational aspects	105
3.8.3	Error estimates under smoothness assumptions	108
3.8.4	Quadrature methods for integral equations	118
3.8.5	Accelerated methods	122
3.9	Qualitative Properties of Convergence	124
3.9.1	Uniform and arbitrarily slow convergence	124
3.9.2	Modification of ASC-methods	127
	Problems	130
4.	Ill-Posed Equations and Their Regularizations	135
4.1	Ill-Posedness of Operator Equations	135
4.1.1	Compact operator equations	136
4.1.2	A backward heat conduction problem	137
4.2	LRN Solution and Generalized Inverse	140
4.2.1	LRN solution	140

4.2.2	Generalized inverse	145
4.2.3	Normal equation	148
4.2.4	Picard criterion	150
4.3	Regularization Procedure	151
4.3.1	Regularization family	151
4.3.2	Regularization algorithm	153
4.4	Tikhonov Regularization	155
4.4.1	Source conditions and order of convergence	162
4.4.2	Error estimates with inexact data	166
4.4.3	An illustration of the source condition	171
4.4.4	Discrepancy principles	172
4.4.5	Remarks on general regularization	183
4.5	Best Possible Worst Case Error	185
4.5.1	Estimates for $\omega(M, \delta)$	188
4.5.2	Illustration with differentiation problem	190
4.5.3	Illustration with backward heat equation	192
4.6	General Source Conditions	193
4.6.1	Why do we need a general source condition?	193
4.6.2	Error estimates for Tikhonov regularization	195
4.6.3	Parameter choice strategies	196
4.6.4	Estimate for $\omega(M_{\varphi, \rho}, \delta)$	201
	Problems	203
5.	Regularized Approximation Methods	207
5.1	Introduction	207
5.2	Using an Approximation (T_n) of T	209
5.2.1	Convergence and general error estimates	209
5.2.2	Error estimates under source conditions	213
5.2.3	Error estimates for Ritz method	214
5.3	Using an Approximation (A_n) of T^*T	217
5.3.1	Results under norm convergence	218
5.4	Methods for Integral Equations	220
5.4.1	A degenerate kernel method	222
5.4.2	Regularized Nyström method	230
	Problems	238
	<i>Bibliography</i>	241
	<i>Index</i>	247
