

<i>Foreword</i>	<i>vii</i>
1. Markov reliability and availability analysis	
1.1 Introduction	1
1.2 Discrete-time, discrete-state Markov processes	2
1.2.1 The conceptual model	2
1.2.2 State probabilities	5
1.2.3 Multi-step transition probabilities	7
1.2.4 Solution of the fundamental equation	9
1.2.5 Steady state probabilities for ergodic systems	19
1.2.6 First passage probabilities	20
1.3 Continuous time, discrete-state Markov processes	24
1.3.1 The conceptual model	24
1.3.2 Solution of the fundamental equation	30
1.3.3 Failure intensity	34
1.3.4 Average time of occupancy of a given state	36
1.3.5 System availability	37
1.3.6 System reliability	38
2. Monte Carlo simulations for reliability and availability analysis	
2.1 Introduction	59
2.2 Monte Carlo simulation for system engineering	60
2.3 Monte Carlo simulation for system unreliability and unavailability estimation	
2.3.1 Indirect and direct Monte Carlo simulation	66
3. Markov Chain Monte Carlo for applications to reliability and availability analysis	
3.1 Introduction	71
3.2 The Metropolis-Hastings algorithm	73
3.2.1 Application to the estimation of the failure rate of a deteriorating component	74
3.3 The Gibbs sampler	78
3.3.1 Application to the estimation of a rare failures process	80
3.4 The reversible-jump MCMC algorithm	83
3.4.1 Application to the estimation of the failure rate of a component subject to degradation or improvement	88
3.4.2 Application to the estimation of the parameters of a deterioration process due to fatigue	95
3.5 Bayesian updating	103
3.6 Practical issues in implementing MCMC algorithms	108
3.6.1 Choice of the kinetics $K(\cdot, \cdot)$	108

3.6.2 Burn-in period	109
3.6.3 Number of iterations	109
3.6.4 Initial conditions	110
3.6.5 Other algorithms	110
4. Basics of genetic algorithms with application to system reliability and availability optimization	
4.1 Introduction	115
4.2 Genetic Algorithms at a glance	117
4.3 The standard Genetic Algorithm	121
4.4 Affine transforming the chromosome fitness	124
4.5 More sophisticated breeding procedures	131
4.6 Efficiency of breeding procedures	134
4.6.1 The figures of merit	134
4.6.2 The test functions	138
4.6.3 Results	144
4.7 Inducement of species and niches	151
4.7.1 Isolation by distance	151
4.7.2 Spatial mating	152
4.7.3 Sharing	153
4.8 Multi-objective optimization	155
4.9 Application of genetic algorithms to RAMS	158
4.10 Examples	163
4.10.1 Multi-objective optimization of system design: a simple application	163
4.10.2 Multi-objective optimization of the inspection policy of a nuclear safety system	169
4.11 Discussion	180
5. Dependent failures	
5.1 Introduction	187
5.2 General classification	188
5.3 Identification of dependent failures and protection from their occurrence	191
5.4 Definition of dependent failures	192
5.5 Methods for dependent-failure analysis	194
5.5.1 Examples of explicit methods	194
5.5.2 An example of an implicit method for modeling dependent failures	205
5.6 A methodological framework for common cause failures analysis	208

5.6.1 System logic model development	208
5.6.2 Identification of common cause component groups	208
5.6.3 Common cause failure modeling and data analysis	212
6. Importance measures	
6.1 Introduction	235
6.2 Birnbaum's measure	238
6.2.1 Relation with the system structure function	239
6.3 Criticality importance	243
6.4 Fussell-Vesely importance measure	245
6.5 Risk Achievement Worth and Risk Reduction Worth	249
6.5.1 Risk Achievement Worth	249
6.5.2 Risk Reduction Worth	249
6.6 Observations and limitations of importance measures	252
6.7 Generalized risk importance measure	257
6.8 Importance measures for multiple basic events	259
6.8.1 Risk Achievement Worth	259
6.8.2 Birnbaum importance measure	261
6.8.3 Fussell-Vesely importance	262
6.8.4 Risk Reduction Worth	263
6.9 Relationship of importance measures to system risk changes	264
6.10 The Differential Importance Measure (DIM)	265
6.11 Importance measures for multi-state systems	277
6.11.1 Introduction	277
6.11.2 The model of a multi-state system	278
6.11.3 Importance measures for multi-state systems	279
6.11.4 Importance measures based on limitations on the performance of multi-state components	281
6.11.5 Comparison of importance measures for multi-state systems	288
7. Basic concepts of uncertainty and sensitivity analysis	
7.1 Introduction	295
7.2 Local and global uncertainty analysis	297
7.3 Approximated analytical methods: the method of moments	300
7.4 Discrete methods	302
7.4.1 Sensitivity on the nominal range	302
7.4.2 Event and probability tree	303
7.4.3 Discrete probability method	305
7.5 Monte Carlo method	306
7.6 Linear regression method	307

7.7 The variance decomposition method	310
7.8 Sobol indexes and Fourier Amplitude Sensitivity Test	323
7.9 Model structure uncertainty	325
7.9.1 The alternative models approach	325
7.9.2 Adjustment factor approach	326
