<i>Preface</i>	vii
<i>Acknowledgments</i>	ix
1. Perturbative quantum field theory and Feynman diagrams	1
1.1 A calculus exercise in Feynman integrals . . . . .	1
1.2 From Lagrangian to effective action . . . . .	6
1.3 Feynman rules . . . . .	9
1.4 Simplifying graphs: vacuum bubbles, connected graphs . .	12
1.5 One-particle-irreducible graphs . . . . .	14
1.6 The problem of renormalization . . . . .	18
1.7 Gamma functions, Schwinger and Feynman parameters .	20
1.8 Dimensional Regularization and Minimal Subtraction . .	21
2. Motives and periods	25
2.1 The idea of motives . . . . .	25
2.2 Pure motives . . . . .	28
2.3 Mixed motives and triangulated categories . . . . .	34
2.4 Motivic sheaves . . . . .	37
2.5 The Grothendieck ring of motives . . . . .	38
2.6 Tate motives . . . . .	39
2.7 The algebra of periods . . . . .	44
2.8 Mixed Tate motives and the logarithmic extensions . . . .	45
2.9 Categories and Galois groups . . . . .	49
2.10 Motivic Galois groups . . . . .	50

3.	Feynman integrals and algebraic varieties	53
3.1	The parametric Feynman integrals . . . . .	54
3.2	The graph hypersurfaces . . . . .	60
3.3	Landau varieties . . . . .	65
3.4	Integrals in affine and projective spaces . . . . .	67
3.5	Non-isolated singularities . . . . .	71
3.6	Cremona transformation and dual graphs . . . . .	72
3.7	Classes in the Grothendieck ring . . . . .	76
3.8	Motivic Feynman rules . . . . .	78
3.9	Characteristic classes and Feynman rules . . . . .	81
3.10	Deletion-contraction relation . . . . .	84
3.11	Feynman integrals and periods . . . . .	93
3.12	The mixed Tate mystery . . . . .	94
3.13	From graph hypersurfaces to determinant hypersurfaces . . . . .	97
3.14	Handling divergences . . . . .	112
3.15	Motivic zeta functions and motivic Feynman rules . . . . .	115
4.	Feynman integrals and Gelfand–Leray forms	119
4.1	Oscillatory integrals . . . . .	119
4.2	Leray regularization of Feynman integrals . . . . .	121
5.	Connes–Kreimer theory in a nutshell	127
5.1	The Bogolyubov recursion . . . . .	128
5.1.1	Step 1: Preparation . . . . .	128
5.1.2	Step 2: Counterterms . . . . .	128
5.1.3	Step 3: Renormalized values . . . . .	129
5.2	Hopf algebras and affine group schemes . . . . .	130
5.3	The Connes–Kreimer Hopf algebra . . . . .	133
5.4	Birkhoff factorization . . . . .	135
5.5	Factorization and Rota–Baxter algebras . . . . .	137
5.6	Motivic Feynman rules and Rota–Baxter structure . . . . .	139
6.	The Riemann–Hilbert correspondence	143
6.1	From divergences to iterated integrals . . . . .	143
6.2	From iterated integrals to differential systems . . . . .	145
6.3	Flat equisingular connections and vector bundles . . . . .	146
6.4	The “cosmic Galois group” . . . . .	147

7.	The geometry of DimReg	151
7.1	The motivic geometry of DimReg . . . . .	151
7.2	The noncommutative geometry of DimReg . . . . .	155
8.	Renormalization, singularities, and Hodge structures	167
8.1	Projective Radon transform . . . . .	167
8.2	The polar filtration and the Milnor fiber . . . . .	170
8.3	DimReg and mixed Hodge structures . . . . .	173
8.4	Regular and irregular singular connections . . . . .	176
9.	Beyond scalar theories	185
9.1	Supermanifolds . . . . .	185
9.2	Parametric Feynman integrals and supermanifolds . . . . .	190
9.3	Graph supermanifolds . . . . .	199
9.4	Noncommutative field theories . . . . .	201
	<i>Bibliography</i>	207
	<i>Index</i>	215
