Preface	v
0. Introduction	1
1. The Main Equations and Approaches to Solutions of the Problems in Rarefied Gas Dynamics	23
1.1. The Main Equations in Rarefied Gas Dynamics	23
1.2. The Main Approaches to the Construction of Statistical Algorithms	25
1.3. Connection of the Stationary Modeling with the Solution of Equation	26
1.4. Construction of the Method of Direct Statistical Modeling	28
2. Development of the Numerical Methods of Solution of the Linear Kinetic Equations	30
2.1. The Perfection of VGK Method (Vlasov, Gorelov, Kogan)	30
2.2. Modification of the Vlasov's Method for the Solution of Linear Problems	35
2.3. Method of Solution of the Linearized Boltzmann's Equation	38
3. Methods of Solution of the Nonlinear Problems in Rarefied Gas Dynamics	43
3.1. Method of Solution of the Model Equation Based on a Stationary Modeling	43
3.2. The Possibilities of the Scheme of Splitting for the Solution of Kinetic Equations	46
3.3. Increase of the Method's Rate of Convergence	52
3.4. Method by Belotserkovskii and Yanitskii	54

4. Modeling of the Flow of Continuous Media	58
4.1. Procedure of the Monte Carlo Methods for Modeling the Flows of Rarefied Gas and Continuous Medium	58
4.2. Method “Relaxation–Transfer” for a Solution of the Problems of Gas Dynamics in the Wide Range of the Degree of Rarefaction of a Medium (see Kogan <i>et al.</i> ⁸³)	62
4.3. Modeling of the Flows of Nonviscous Perfect Gas	66
5. Solution of the Navier–Stokes Equations (Petrov ^{133–139})	72
5.1. Formulation of the Problem, Initial and Boundary Conditions for the Navier–Stokes Equations in the Form by Helmholtz	72
5.2. The General Properties of the Vertical Flow Arising by the Instantaneous Start of a Body from the State of Rest	74
5.3. Initial Conditions for the Problem of the Instantaneous Start of a Body in a Viscous Fluid	78
5.4. The General Algorithm of the Numerical Solution of an Initial–Boundary Problem for the Navier–Stokes Equations in the form by Helmholtz	80
5.5. Solution of the Cauchy Problem for the Fokker–Plank Equation at Small Interval of Time	88
5.6. The Numerical Solution of the Fokker–Plank Equation by the Method of Direct Statistical Modeling	95
6. Studies of the Weakly Perturbed Flows of Rarefied Gas	103
6.1. Determination of the Velocity of Slip	103
6.2. Solution of the Problem of the Feeble Evaporation (Condensation) from the Plane Surface (see Korovkin, Khlopkov ¹⁰⁴)	106
6.3. The Slow Motion of a Sphere in Rarefied Gas (Brownian Motion)	108
6.4. The Coefficient of Diffusion and the Mean Shifting of a Brownian Particle in the Rarefied Gas (see Khlopkov ¹⁰⁶)	110
7. Study of the Flows About Different Bodies in Transitional Regime	114
7.1. Flows About the Planar Bodies	115
7.2. Flows About Axisymmetrical Bodies	119

7.3.	Influence of the Evaporation (Condensation) on the Aerodynamical Resistance of a Sphere by the Supersonic Flow About It	125
7.4.	Computation of the Steady Regime of a Flow About a Body and of the Profile Resistance in a Viscous Gas (See A.S. Petrov)	128
8.	Determination of the Aerodynamical Characteristics of the Returnable Space Systems (RSS)	138
8.1.	Methodics of the Description of a Surface	138
8.2.	Methodics of Calculation of the Aerodynamical Characteristics of the Flying Apparatus in the Conditions of a Free-Molecular Flow	142
8.3.	The Engineering Methodics of the Computation of Aerodynamical Characteristics of the Bodies of Complicated Form in a Transitional Regime (see Galkin, Eropheev, Tolstykh ⁸⁵)	143
8.4.	The Results of the Flow About a Hypersonic Flying Apparatus “Clipper” (see Voronich, Zey Yar ²²⁵)	145
9.	The Flow About Blunted Bodies with the Addition of Heat (see Vorovich, Moiseev)	165
9.1.	The Main Features of a Method	165
9.2.	Description of the Algorithm	167
9.3.	The Approximational Properties	170
9.4.	The Algorithm and the Nets	172
9.5.	Direct Statistical Modeling of the Inviscid Flows About Blunted Bodies by the Presence of Energy Addition	175
10.	The General Models of Description of the Turbulent Flows	187
10.1.	Theoretical Methods of the Description of Turbulence	187
10.2.	Coherent Structures in the Turbulent Boundary Layer (see Khlopkov, Zharov, Gorelov ²⁰⁵)	194
10.3.	The Description of Turbulence with the Help of a Model of the Three-Wave Resonance	204
10.4.	The Fluidical Model of the Description of Turbulence (Belotserkovskii, Yanitskii)	208

11. Studies of the Turbulent Flow of Fluid and Gas 211

 11.1. Modeling of a Turbulent Transition within the Boundary Layer Using Monte Carlo Method (see Zharov, Tun Tun, Khlopkov²²³) 211

 11.2. Study of the Dissipation of Turbulent Spots (see Belotserkovskii, Yanitskii, Bukin^{12,221}) 218

 11.3. Evolution of the Vertical System in the Rarefied Gas (see Roven-skaya, Voronich, Zharov²²²) 219

12. The Possible Directions of Development of the Methods of Statistical Study 228

 12.1. Development of the Methods of Solution of Linear Problems 228

 12.2. Use of the Possibilities of the Model Equations 232

 12.3. Modeling of the Flows of Continuous Medium 235

 12.4. Modeling of the Turbulent Flows of Fluid and Gas 240

 12.5. Parallelization of the Statistical Algorithms (Bukin, Voronich, Shtarkin) 245

Conclusions 253
