Dedication	vii
Preface	ix
Changes from first edition	xiii
Acknowledgements	xxvii
List of Figures	xxix
Part 1. Elastic continua	1
Introduction to Part 1	3
Chapter 1. Deformations	7
Preliminary Remarks	7
1.1. Notion of Continuum	8
1.2. Rudiments of Continuum Mechanics	10
1.2.1. Axiomatic format	10
1.2.2. Primitive concepts of continuum mechanics	10
1.3. Material and Spatial Descriptions	14
1.3.1. Fundamental concepts	14
1.3.2. Material time derivative	15
1.3.3. Conditions of linearized theory	18
1.4. Strain	22
1.4.1. Introductory comments	22
1.4.2. Derivation of strain tensor	23
1.4.3. Physical meaning of strain tensor	27
1.5. Rotation Tensor and Rotation Vector	33
Closing Remarks	34
1.6. Exercises	34

Chapter 2. Forces and Balance Principles	43
Preliminary Remarks	43
2.1. Conservation of Mass	44
2.1.1. Introductory comments	44
2.1.2. Integral equation	44
2.1.3. Equation of continuity	46
2.2. Time Derivative of Volume Integral	47
2.3. Stress	49
2.3.1. Stress as description of surface forces	49
2.3.2. Traction	50
2.4. Balance of Linear Momentum	51
2.5. Stress Tensor	54
2.5.1. Traction on coordinate planes	54
2.5.2. Traction on arbitrary planes	56
2.6. Cauchy's Equations of Motion	60
2.6.1. General formulation	60
2.6.2. Example: Surface-forces formulation	63
2.7. Balance of Angular Momentum	66
2.7.1. Introductory comments	66
2.7.2. Integral equation	68
2.7.3. Symmetry of stress tensor	69
2.8. Fundamental Equations	72
Closing Remarks	74
2.9. Exercises	74
Chapter 3. Stress-Strain Equations	83
Preliminary Remarks	83
3.1. Rudiments of Constitutive Equations	84
3.2. Formulation of Stress-Strain Equations: Hookean Solid	85
3.2.1. Introductory comments	85
3.2.2. Tensor form	87
3.2.3. Matrix form	90
3.3. Determined System	92
3.4. Anelasticity: Example	93
3.4.1. Introductory comments	93
3.4.2. Viscosity: Stokesian fluid	93

3.4.3. Viscoelasticity: Kelvin-Voigt model	94
Closing Remarks	97
3.5. Exercises	97
Chapter 4. Strain Energy	103
Preliminary Remarks	103
4.1. Strain-energy Function	104
4.2. Strain-energy Function and Elasticity-tensor Symmetry	106
4.2.1. Fundamental considerations	106
4.2.2. Elasticity parameters	108
4.2.3. Matrix form of stress-strain equations	108
4.2.4. Coordinate transformations	109
4.3. Stability Conditions	110
4.3.1. Physical justification	110
4.3.2. Mathematical formulation	110
4.3.3. Constraints on elasticity parameters	111
4.4. System of Equations for Elastic Continua	111
4.4.1. Elastic continua	111
4.4.2. Governing equations	113
Closing Remarks	114
4.5. Exercises	115
Chapter 5. Material Symmetry	121
Preliminary Remarks	121
5.1. Orthogonal Transformations	122
5.1.1. Transformation matrix	122
5.1.2. Symmetry group	122
5.2. Transformation of Coordinates	123
5.2.1. Introductory comments	123
5.2.2. Transformation of stress-tensor components	123
5.2.3. Transformation of strain-tensor components	127
5.2.4. Stress-strain equations in transformed coordinates	129
5.2.5. On matrix forms	129
5.3. Condition for Material Symmetry	131
5.4. Point Symmetry	133
5.5. Generally Anisotropic Continuum	134

5.6.	Monoclinic Continuum	135
5.6.1.	Elasticity matrix	135
5.6.2.	Vanishing of tensor components	136
5.6.3.	Natural coordinate system	137
5.7.	Orthotropic Continuum	140
5.8.	Trigonal Continuum	142
5.8.1.	Elasticity matrix	142
5.8.2.	Natural coordinate system	144
5.9.	Tetragonal Continuum	145
5.10.	Transversely Isotropic Continuum	146
5.10.1.	Elasticity matrix	146
5.10.2.	Rotation invariance	147
5.11.	Cubic Continuum	152
5.12.	Isotropic Continuum	154
5.12.1.	Elasticity matrix	154
5.12.2.	Lamé's parameters	155
5.12.3.	Tensor formulation	156
5.12.4.	Physical meaning of Lamé's parameters	157
5.13.	Relations Among Symmetry Classes	159
	Closing Remarks	160
5.14.	Exercises	161
Part 2.	Waves and rays	179
	Introduction to Part 2	181
Chapter 6.	Equations of Motion: Isotropic Homogeneous Continua	183
	Preliminary Remarks	183
6.1.	Wave Equations	184
6.1.1.	Equation of motion	184
6.1.2.	Wave equation for P waves	187
6.1.3.	Wave equation for S waves	188
6.1.4.	Physical interpretation	190
6.2.	Plane Waves	192
6.3.	Displacement Potentials	194
6.3.1.	Helmholtz's decomposition	194

6.3.2.	Gauge transformation	195
6.3.3.	Equation of motion	196
6.3.4.	P and S waves	197
6.4.	Solutions of Wave Equation for Single Spatial Dimension	199
6.4.1.	d'Alembert's approach	199
6.4.2.	Directional derivative	204
6.4.3.	Well-posed problem	205
6.4.4.	Causality, finite propagation speed and sharpness of signals	210
6.5.	Solution of Wave Equation for Two and Three Spatial Dimensions	212
6.5.1.	Introductory comments	212
6.5.2.	Three spatial dimensions	213
6.5.3.	Two spatial dimensions	215
6.6.	On Evolution Equation	217
6.7.	Solutions of Wave Equation for One-Dimensional Scattering	220
6.8.	On Weak Solutions of Wave Equation	228
6.8.1.	Introductory comments	228
6.8.2.	Weak derivatives	229
6.8.3.	Weak solution of wave equation	230
6.9.	Reduced Wave Equation	232
6.9.1.	Harmonic-wave trial solution	232
6.9.2.	Fourier's transform of wave equation	234
6.10.	Extensions of Wave Equation	235
6.10.1.	Introductory comments	235
6.10.2.	Standard wave equation	236
6.10.3.	Wave equation and elliptical velocity dependence	237
6.10.4.	Wave equation and weak inhomogeneity	241
	Closing Remarks	247
6.11.	Exercises	248
Chapter 7.	Equations of Motion: Anisotropic Inhomogeneous Continua	275
	Preliminary Remarks	275
7.1.	Formulation of Equations	276

7.2. Formulation of Solutions	277
7.2.1. Introductory comments	277
7.2.2. Trial-solution formulation: General wave	277
7.2.3. Trial-solution formulation: Harmonic wave	280
7.2.4. Asymptotic-series formulation	283
7.3. Eikonal Equation	288
Closing Remarks	292
7.4. Exercises	292
 Chapter 8. Hamilton's Ray Equations	 305
Preliminary Remarks	305
8.1. Method of Characteristics	306
8.1.1. Level-set functions	306
8.1.2. Characteristic equations	307
8.1.3. Consistency of formulation	311
8.2. Time Parametrization of Characteristic Equations	312
8.2.1. General formulation	312
8.2.2. Equations with variable scaling factor	313
8.2.3. Equations with constant scaling factor	314
8.2.4. Formulation of Hamilton's ray equations	315
8.3. Physical Interpretation of Hamilton's Ray Equations and Solutions	316
8.3.1. Equations	316
8.3.2. Solutions	317
8.4. Relation between \mathbf{p} and $\dot{\mathbf{x}}$	317
8.4.1. General formulation	317
8.4.2. Phase and ray velocities	318
8.4.3. Phase and ray angles	321
8.4.4. Geometrical illustration	323
8.5. Example: Elliptical Anisotropy and Linear Inhomogeneity	324
8.5.1. Introductory comments	324
8.5.2. Eikonal equation	324
8.5.3. Hamilton's ray equations	326
8.5.4. Initial conditions	327
8.5.5. Physical interpretation of equations and conditions	328

8.5.6.	Solution of Hamilton's ray equations	330
8.5.7.	Solution of eikonal equation	334
8.5.8.	Physical interpretation of solutions	335
8.6.	Example: Isotropy and Inhomogeneity	336
8.6.1.	Parametric form	336
8.6.2.	Explicit form	337
Closing Remarks		338
8.7.	Exercises	339
Chapter 9.	Christoffel's Equations	355
Preliminary Remarks		355
9.1.	Explicit form of Christoffel's Equations	356
9.2.	Christoffel's Equations and Anisotropic Continua	360
9.2.1.	Introductory comments	360
9.2.2.	Monoclinic continua	361
9.2.3.	Transversely isotropic continua	366
9.3.	Phase-slowness Surfaces	374
9.3.1.	Introductory comments	374
9.3.2.	Convexity of innermost sheet	374
9.3.3.	Intersection points	375
Closing Remarks		378
9.4.	Exercises	378
Chapter 10.	Reflection and Transmission	387
Preliminary Remarks		387
10.1.	Angles at Interface	388
10.1.1.	Phase angles	388
10.1.2.	Ray angles	390
10.1.3.	Example: Elliptical velocity dependence	391
10.2.	Amplitudes at Interface	394
10.2.1.	Kinematic and dynamic boundary conditions	394
10.2.2.	Reflection and transmission amplitudes	400
Closing Remarks		406
10.3.	Exercises	407
Chapter 11.	Lagrange's Ray Equations	413
Preliminary Remarks		413

11.1. Legendre's Transformation of Hamiltonian	414
11.2. Formulation of Lagrange's Ray Equations	414
11.3. Beltrami's Identity	417
Closing Remarks	417
11.4. Exercises	418
Part 3. Variational formulation of rays	423
Introduction to Part 3	425
Chapter 12. Euler's Equations	429
Preliminary Remarks	429
12.1. Mathematical Background	430
12.2. Formulation of Euler's Equation	431
12.3. Beltrami's Identity	434
12.4. Generalizations of Euler's Equation	434
12.4.1. Introductory comments	434
12.4.2. Case of several variables	435
12.4.3. Case of several functions	435
12.4.4. Higher-order derivatives	436
12.5. Special Cases of Euler's Equation	437
12.5.1. Introductory comments	437
12.5.2. Independence of z	437
12.5.3. Independence of x and z	438
12.5.4. Independence of x	439
12.5.5. Total derivative	439
12.5.6. Function of x and z	440
12.6. First Integrals	443
12.7. Lagrange's Ray Equations as Euler's Equations	444
Closing Remarks	445
12.8. Exercises	445
Chapter 13. Variational Principles	455
Preliminary Remarks	455
13.1. Fermat's Principle	456
13.1.1. Statement of Fermat's principle	456
13.1.2. Properties of Hamiltonian \mathcal{H}	457

13.1.3.	Variational equivalent of Hamilton's ray equations	458
13.1.4.	Properties of Lagrangian \mathcal{L}	458
13.1.5.	Parameter-independent Lagrange's ray equations	461
13.1.6.	Ray velocity	462
13.1.7.	Proof of Fermat's principle	462
13.2.	Hamilton's Principle: Example	464
13.2.1.	Introductory comments	464
13.2.2.	Action	464
13.2.3.	Lagrange's equations of motion	467
13.2.4.	Wave equation	469
	Closing Remarks	473
13.3.	Exercises	473
Chapter 14. Ray Parameters		483
	Preliminary Remarks	483
14.1.	Traveltime Integrals	484
14.2.	Ray parameters as First Integrals	485
14.3.	Example: Elliptical Anisotropy and Linear Inhomogeneity	486
14.3.1.	Introductory comments	486
14.3.2.	Rays	487
14.3.3.	Traveltimes	490
14.4.	Rays in Isotropic Continua	493
14.5.	Lagrange's Ray Equations in xz -Plane	494
14.6.	Conserved Quantities and Hamilton's Ray Equations	495
	Closing Remarks	497
14.7.	Exercises	497
Part 4. Appendices		509
Introduction to Part 4		511
Appendix A. Euler's Homogeneous-Function Theorem		513
	Preliminary Remarks	513
A.1.	Homogeneous Functions	514
A.2.	Homogeneous-Function Theorem	515

Closing Remarks	517
Appendix B. Legendre's Transformation	519
Preliminary Remarks	519
B.1. Geometrical Context	520
B.1.1. Surface and Its Tangent Planes	520
B.1.2. Single-variable case	520
B.2. Duality of Transformation	522
B.3. Transformation between Lagrangian \mathcal{L} and Hamiltonian \mathcal{H}	523
B.4. Transformation and Ray Equations	524
Closing Remarks	526
Appendix C. List of Symbols	527
C.1. Mathematical Relations and Operations	527
C.2. Physical Quantities	528
C.2.1. Greek letters	528
C.2.2. Roman letters	529
Bibliography	531
Index	553
About the Author	583
