<i>Preface</i>	vii
<i>Notations and Fundamental Constants</i>	xi
1. Basic Concepts	1
1.1 Introduction	1
1.2 Master Equation and Hypothesis of Equal á-priori Probability	3
1.2.1 Example of 3 Level Systems	4
1.3 Phase Space, Phase Point, Phase Trajectory	4
1.4 Statistical Distribution Function and Ergodic Hypothesis	5
1.5 Statistical Fluctuation and Statistical Independence	7
1.6 Statistical Fluctuation and Generalized Susceptibility	11
1.7 Generalized Ornstein-Zernicke Relation	13
1.8 Problems	15
2. Motion of Systems in Phase Space	17
2.1 Integral Invariants	17
2.2 Classical Liouville's Equation	20
2.3 Role of Energy	22
2.4 Quantum Mechanical Density Matrix	22
2.5 Quantum Liouville's Equation	24
2.6 Problems	26
3. States in Statistical Physics	27

3.1	Microscopic and Macroscopic States	27
3.2	Statistical Weight and Density of States	28
3.3	Examples: Non-interacting One- and N-Particle Systems and Spin-1/2 Particles	29
3.4	Entropy and Boltzmann's Principle	31
3.5	Boltzmann's H -Theorem	34
3.6	Problems	35
4.	Statistical Ensembles	37
4.1	Introduction	37
4.2	Microcanonical Distribution Function	37
4.3	Canonical (Gibbs) Distribution Function	39
4.3.1	Thermodynamic Temperature and Distribution Function	39
4.3.2	Spin-1/2 Particles and Negative Temperature	40
4.3.3	Partition Function and Different Thermodynamic Functions	41
4.3.4	System of Linear Harmonic Oscillators in Canonical Ensemble	42
4.3.5	Energy Fluctuation in Canonical Ensemble and Equivalence of Canonical and Microcanonical Ensembles	43
4.4	Grandcanonical Distribution Function	44
4.4.1	Dependence of Thermodynamic Functions on Number of Particles	44
4.4.2	Chemical Potential and Distribution Function	47
4.4.3	Density Fluctuation in Grandcanonical Ensemble and Equivalence of Grandcanonical and Canonical Ensembles	49
4.5	Problems	50
5.	Ideal Gas	51
5.1	Boltzmann Distribution	51
5.2	Partition Function, Free Energy and Equation of State	52
5.3	Specific Heat: Translational, Vibrational and Rotational Components	55
5.4	Degeneracy Temperature	59
5.5	Problems	61

6. Chemical Reaction Equilibrium	63
6.1 Conditions of Chemical Equilibrium	63
6.2 Law of Mass Action	65
6.3 Heat of Reaction and Direction of Reaction	66
6.4 Ionization Equilibrium	68
6.5 Saha Formula	70
6.6 Problems	71
7. Real Gas	73
7.1 Free Energy, Virial Equation of State	73
7.2 Second Virial Coefficient and Applicability of Virial Equation	76
7.3 Model Calculation and van-der-Waal's Equation of State	78
7.4 Joule-Thomson Expansion and Inversion Temperature	80
7.5 Problems	83
8. Strong Electrolytes	85
8.1 Debye-Hückel Approximation, Debye Length	85
8.2 Screened Coulomb Potential	88
8.3 Equation of State and Osmotic Pressure	89
8.4 Problems	90
9. Quantum Statistics	91
9.1 Bose and Fermi Distributions	91
9.2 Quantum Gases of Elementary Particles: Number Density and Chemical Potential, Energy Density, Equation of State	94
9.3 Black Body Radiation and Planck's Law	98
9.4 Lattice Specific Heat and Phonons	100
9.5 Degenerate Bose Gas, Bose Condensation	103
9.6 Liquid He and Superfluidity	106
9.6.1 Systematics of Liquid 4He	106
9.6.2 Landau's 2-Fluid Model	111
9.6.3 Systematics of Liquid 3He	117
9.7 Degenerate Fermi Gas, Degeneracy Pressure, Specific Heat	118
9.8 Magnetism of Free Fermions	124
9.8.1 Preamble	124
9.8.2 Landau Diamagnetism	124
9.8.3 Pauli Paramagnetism	127

9.9	Interacting Fermi System: Fermi Liquid Theory	129
9.10	Relativistic Degenerate Fermi Gas	133
9.11	Problems	136
10.	Bose-Einstein Condensate	139
10.1	Introduction	139
10.2	Trapping of Atoms	140
10.3	Cooling of Atoms	142
10.4	Problems	145
11.	Statistical Astrophysics	147
11.1	Introduction	147
11.2	Stars: Stability and Evolution	148
11.3	High Temperature Dense Matter	152
11.4	Neutron Stars and Black Holes	154
11.5	Problems	156
12.	Phase Transitions	157
12.1	Systematics of Phase Transitions	157
12.2	Ehrenfest's Classification of Phase Transitions	159
12.3	Order Parameter, Continuous and Discontinuous Transitions	160
12.4	Landau's Theory of Continuous Phase Transitions	163
12.5	Continuity of Entropy and Discontinuity of Specific Heat	165
12.6	Generalized Susceptibility	167
12.7	Critical Exponents and Fluctuations of Order Parameter	170
12.8	Ising Model	173
	12.8.1 Zero-Field 1-Dimensional Case	175
	12.8.2 Non-Zero-Field 1-Dimensional Case	175
	12.8.3 Multi-Dimensional Case	177
	12.8.4 2-Dimensional Ising System	178
12.9	Problems	181
13.	Irreversible Processes	183
13.1	Introduction	183
13.2	Linear Response Theory (Kubo Formalism)	184
	13.2.1 Mechanical Process	184
	13.2.2 Thermal Process	189

13.3	Symmetry Relations	191
13.4	Fluctuation-Dissipation Theorem	192
13.5	Problems	196
14.	Mathematical Appendix	197
14.1	Beta and Gamma Functions	197
14.2	Dirac Delta Function (Distribution)	198
14.3	Functional Derivative	200
14.4	Mathematical Identities	201
14.5	Multiple Summation	202
14.6	Pauli Matrices	203
14.7	Probability Theory	203
	14.7.1 Elementary Results of Probability Theory	203
	14.7.2 Statistical Distributions	204
	14.7.3 Central Limit Theorem	207
14.8	Quantum Mechanics, A Retrospect	209
14.9	Riemann, Bernoulli and Fourier	210
	14.9.1 Riemann's ζ -Function	210
	14.9.2 Bernoulli Numbers and Polynomials	211
	14.9.3 Fourier Series	212
	14.9.4 Integrals of Quantum Statistics	214
14.10	Sanskrit Transliteration	216
14.11	Stirling's Theorem	217
14.12	Summation and Integration	219
14.13	Volume of an N-Dimensional Sphere	220
	<i>Bibliography</i>	223
	<i>Index</i>	225
