Preface xv

PART I

QUANTUM STATISTICAL MECHANICS 1

CHAPTER 1

THE LIOUVILLE EQUATION IN CLASSICAL MECHANICS 3

1. Introduction: Statistical approach in classical
and quantum mechanics 3

2. The classical statistical approach 5

 a) A transformation operator G 5

 b) Probability density \mathcal{D} 6

 c) The Liouville theorem 7

 d) Time dependent probability density \mathcal{D}_{t,t_0} 9

3. Quantum analogy 11

4. Symmetry properties 12

5. Isolated dynamical systems 14

6. A system of identical monoatomic molecules 15

7. Property of reversibility 17

CHAPTER 2

THE LIOUVILLE EQUATION IN QUANTUM MECHANICS 18

1. The X -representation 18

2. Quantum statistical approach 21

 a) Statistical operators 21

 b) The Liouville equation 23

c) Operator U_{t, t_0}	24
d) Properties of the statistical operators	27
3. Symmetry properties	28
4. Discrete X -representation	33
5. Discrete momentum representation	35
6. Compatibility with the Schroedinger equation	36
7. Limit transition and cyclic boundary condition	38
8. An isolated dynamical system	41
9. Conservation and non-conservation of particle number	43
a) N -particle wave functions	43
b) X -representation for variable particle numbers	45
c) The Hilbert space of wave functions and its subspaces	47
d) A projection operator	49
e) A combined index	50

CHAPTER 3

CANONICAL DISTRIBUTION AND

THERMODYNAMIC FUNCTIONS 51

1. Integrals of motion	51
2. The Gibbs canonical distribution	52
3. Thermodynamic functions	54
4. Quasi-static processes	56
a) The concept of quasi-static process	56
b) Construction of quasi-static processes	58
c) Interpretation of terms	60
d) Heat capacity	61
e) Homogeneous systems	62
f) Relation between H and E	62
5. Passing to limits	64
a) Basic assumptions	64
b) Boundary surface	65
c) Limits	66
d) Validity of speculations on passing to limits	67
6. The grand canonical ensemble	68
a) Statistical operators	68
b) Definitions of μ , Γ , and G	69
c) Uniqueness of μ_j	70

d) Thermodynamic functions	73
e) Passing to the limit $V \rightarrow \infty$	75
7. Quantum approach in the theory of classical canonical distribution	77
8. Entropy of dynamical systems	79
a) Canonical ensemble	79
b) Extremum property of the entropy	80
c) An auxiliary operator	80
d) The grand canonical ensemble	82
e) Time independence	84
f) Entropy of non-equilibrium states	84
g) Difficulties connected with study of non-equilibrium processes	86

CHAPTER 4

TWO-TIME CORRELATION FUNCTIONS AND THE GREEN FUNCTIONS IN THE THEORY OF STATISTICAL EQUILIBRIUM 88

1. Two-time correlation functions for quantum systems	88
2. Spectral Intensity	91
a) Definition	91
b) Basic properties	92
3. The two-time Green function	94
a) Definitions	94
b) The Fourier representations	95
c) Passing to the limit	95
d) Basic properties	98
4. Infinitesimal perturbation	99
a) A perturbation Hamiltonian	99
b) Variation of a average value	100
c) The retarded and advanced Green Functions	102
d) Some remarks	103
5. The Green function for classical systems	104
a) Correlation functions and the spectral intensity	105
b) Average values of the poisson brackets	108
c) The retarded and advanced Green functions	109
d) Basic properties	111
6. Classical variation of average value	113
7. The Laplace transformation of correlation functions	116

CHAPTER 5

STATISTICAL OPERATORS 119

1. Introduction	119
2. Statistical operators of particle complexes	120
a) Wave functions and operators	120
b) Statistical operators	120
c) Statistical operators of particle complexes	121
d) Fluctuations	124
e) Some properties of the statistical operators of particle complexes	126
3. Time evolution of the statistical operators	127
a) A hierarchy of equations for the reduced statistical operators	127
b) Some remarks on the physical meaning of the hierarchy of equations	130
4. The application of the method of statistical operators to systems of monoatomic spinless molecules	132
a) A model and the evolution equation	132
b) Passing to statistical operators F_s	132
c) The limit equation of evolution of statistical operators	134
d) The density of particle number and its fluctuation	136
References to Part I.....	139

PART II**SOME ASPECTS OF THE METHOD****OF SECONDARY QUANTIZATION 143**

CHAPTER 1

MATRIX REPRESENTATION OF SYMMETRIC

DYNAMICAL OPERATORS 146

1. Introduction	146
2. Symmetry properties	147
a) Permutations	147
b) Symmetry and antisymmetry	149
3. Symmetric operators	149
a) Symmetric single-particle operators	150

b) Symmetric two-particle operators	151
c) Symmetric s -particle operators	152
4. Some identities	153
5. Hamiltonians	155

CHAPTER 2

PASSING FROM CONTINUOUS TO DISCRETE

REPRESENTATION. INTRODUCTION

OF THE OCCUPATION NUMBERS	157
-------------------------------------	-----

1. Representation of wave functions	157
a) Discrete f -representation	157
b) Discrete momentum representation	159
c) Periodicity	160
d) Passing to the limit. Quasi-discrete representation	161
2. Occupation numbers	162
a) Definition	162
b) Bosons	164
c) Fermions	165

CHAPTER 3

REPRESENTATION OF SECONDARY QUANTIZATION

FOR WAVE FUNCTIONS OF BOSONS AND FERMIONS	167
---	-----

1. Bose statistics	167
a) Operators a and a^+	167
b) Quantum Bose operators a and a^+	169
c) Wave functions	169
2. Fermi statistics	172
a) Operators σ and σ^+	172
b) The Pauli operators	173
c) The Fermi operators a and a^+	175
d) Wave function	177
3. Comparison of wave functions of bosons and fermions	179
4. The representation of secondary quantization	180
5. The operator of particle number	182

CHAPTER 4

REPRESENTATION OF SECONDARY QUANTIZATION

FOR DYNAMICAL OPERATORS 184

1. Introduction	184
2. Lemma	185
a) Proof	186
b) Corollaries of the Lemma	189
3. Wave function	190
a) Inverse of representation	190
b) Invariance of the scalar product	191
4. Transformation of dynamical quantities to the representation of secondary quantization	192
a) Development of the transformation	192
b) Additive dynamical quantities	193
c) The particle-number density	194
d) The particle-number operator	195
e) Binary dynamical quantities	196
f) s -particle operators	198
5. The Hamiltonian in the representation of secondary quantization . .	199
6. The evolution of operator functions	200
a) The Heisenberg representation	200
b) Commutation relations	201
c) Time evolution of operator functions	202
d) Discussion	204

CHAPTER 5

GENERAL REMARKS ON THE METHOD

OF SECONDARY QUANTIZATION 207

1. Systems independent of particle number	207
a) The grand canonical ensemble	207
b) The quasi-discrete representation	208
c) Basis and operator functions	209
d) The representation of secondary quantization for Hamiltonian Γ	210
e) The momentum vector	211
2. Wave functions in the representation of secondary quantization . . .	212
a) Conditions	212
b) Remarks on condition (D)	213

c) Derivation of the expression for a wave function	214
3. Dynamical systems consisting of bosons and fermions of several types	218
a) Ordinary wave functions	218
b) Operator function	219
c) Transformation of dynamical operators	220
d) Dynamical quantities of mixed type	222
e) Independence of the particle number	223
4. Commutation relations for operator functions	224
a) Commutativity of arbitrary type	224
b) Remark on commutativity	226
5. Occupation numbers and the f -representation (Comments on Chapter 2)	226

CHAPTER 6

SOME ANALOGUES OF THE METHOD OF SECONDARY
QUANTIZATION IN CLASSICAL MECHANICS 230

1. The method of secondary quantization	230
a) Time evolution of the Wigner quantum operator	231
b) Passing to the limit $\hbar \rightarrow 0$	234
c) Quantization and secondary quantization	235
2. The transition to classical mechanics	235
a) A binary dynamical quantity	236
b) Time-evolution of function f	237
c) The Vlasov equation	239
3. A system of identical hard spheres	241
a) A system of two identical hard spheres	241
b) A system of N identical hard spheres	247
c) The Boltzmann-Enskog equation	250
d) The diffusion equation of a separate particle in a gas	253
e) Binary interaction	255

References to Part II	257
---------------------------------	-----

PART III
QUADRATIC HAMILTONIANS AND
THEIR APPLICATION 259

CHAPTER 1
QUADRATIC HAMILTONIANS IN STATISTICAL MECHANICS . . . 261

1. Equilibrium properties of ideal gases 261
 - a) Ideal gas 261
 - b) Free energy and average occupation numbers 262
 - c) Spectrum of black-body radiation 265
 - d) Ideal Bose gas 266
 - e) Ideal Fermi gas 267
2. Diagonalization of quadratic form for the Bose and Fermi operators 270
 - a) A method of canonical transformation 271
 - b) An operator form of canonical transformation 273
3. Diagonalization of quadratic Hamiltonians in the theory of superfluidity and superconductivity 275
 - a) The case of Bose-Einstein statistics 276
 - b) The case of Fermi-Dirac statistics 278
 - c) An operator form of canonical transformation for the Bose-Einstein statistic 280
4. The Bloch-de Dominicis statistical theorem 282
 - a) The Bloch-de Dominicis theorem 283
 - b) The proof of the Bloch-de Dominicis theorem 285

CHAPTER 2
DIAGONALIZATION OF ARBITRARY QUADRATIC FORMS 287

1. Diagonalization of a quadratic form of the Bose operators 287
 - a) Canonical transformation 287
 - b) A set of equations for parameters of canonical transformation . . 289
 - c) Matrix form 290
 - d) Eigenvalues 292
 - e) Condition on parameters of the canonical transformation 294
 - f) Diagonalization 297
 - g) Hamiltonian with linear operator term 299
2. Diagonalization of the quadratic form of the Fermi operators 300

a) Canonical transformation	301
b) A set of equations for parameters of canonical transformation . .	302
c) Matrix form	303
d) Eigenvalue	304
e) Condition on parameters of canonical transformation	305
f) A lemma on eigenvectors and eigenvalues	311
g) Diagonalization	313
References to Part III.	315

PART IV
SUPERFLUIDITY AND QUASI-AVERAGES IN
PROBLEMS OF STATISTICAL MECHANICS 317

CHAPTER 1
 SUPERFLUIDITY AND A NON-IDEAL BOSE GAS 319

1. An ideal Bose gas	319
2. Condensation in momentum space and the phenomenon of superfluidity	322
3. Superfluidity	332
a) Quasi-particles	333
b) Occurrence of superfluidity	336
c) Equations of motion	338
d) Elementary excitations and superfluidity	343
e) Remarks	346
f) Momentum distribution	347
g) Correlation function	351
h) Discussion	354

CHAPTER 2
 QUASI-AVERAGES IN PROBLEMS OF STATISTICAL
 MECHANICS 356

1. Green functions constructed from usual averages. Additive conservation laws and selected rules.	356
2. Degeneration of the state of statistical equilibrium. Introduction of quasi-averages.	359

a) Degeneration of states of statistical equilibrium	360
b) Quasi-averages	362
c) Degeneration in the theory of the crystalline state	363
d) An ideal Bose gas	366
e) Quasi-averages in the theory of superconductivity	370
f) The Dicke model	377
g) Quasi-averages for an arbitrary system	380
CHAPTER 3	
ON THE DEFINITION OF QUASI-AVERAGES FOR	
A HAMILTONIAN WITH NEGATIVE FOUR-FERMION	
INTERACTION	383
1. Limit properties of free energies	383
2. Quasi-averages for a Hamiltonian with a negative	
four-fermion interaction	387
CHAPTER 4	
THE PRINCIPLE OF CORRELATION WEAKENING AND	
THEOREMS ON SINGULARITIES OF TYPE $1/q^2$	397
1. Principle of correlation weakening	397
2. Theorems on singularities of type $1/q^2$ and some	
applications of the method of quasi-averages	402
CHAPTER 5	
ON SOME QUESTIONS CONNECTED WITH PROBLEMS	
OF THE FOUNDATION OF STATISTICAL MECHANICS	404
1. Some remarks on the ergodic theory	404
2. A dynamical system interacting with boson field	408
References to Part IV	413
Photos	417
Index	419
