Dedication	v
Preface	vii
List of Figures	xiii
Physical Constants	xv
Introduction	1
I. Fundamentals	7
1. The Closed System or the Microcanonical Ensemble	9
1.1 The Microcanonical Ensemble	9
1.2 Properties of the Entropy	12
1.3 An Example	17
2. The System in Thermal Contact with a Reservoir:	
The Canonical and Grand Canonical Ensembles	22
2.1 The Canonical Ensemble	23
2.1.1 The partition function	23

2.1.2	Energy, entropy and thermodynamic potential	26
2.1.3	A two-level system	29
2.1.4	The ideal gas; equipartition of energy in classical mechanics	30
2.2	The Grand Canonical Ensemble	33
2.2.1	The grand partition function	34
2.2.2	The number of particles, energy, entropy and the grand potential	36
2.2.3	An example	38
2.3	Summary	41
2.3.1	Fluctuations	42
2.3.2	Final remark	43
3.	Quantum Statistics	44
3.1	The Partition Function and the Free Energy	45
3.1.1	For variable N and for fermions	46
3.1.2	For variable N and for bosons	46
3.1.3	For fixed N, and for both fermions and bosons	47
3.2	The Energy and the Entropy	49
3.3	The Classical Ideal Gas: Maxwell–Boltzmann Statistics	50
3.4	Qualitative Behavior of the Chemical Potential and the Derivation of $(\partial\mu/\partial T)_{V,N} < 0$	53
3.4.1	Bosons	53
3.4.2	Fermions	54
4.	The Density of States	55
4.1	The Wave Vector	56
4.2	The Density of States	57
4.3	The Monatomic Ideal Gas	58
4.3.1	The partition function	58
4.3.2	The internal energy, entropy and equation of state	59
4.3.3	The classical limit	60

5. Some Problems 61

5.1 The Quantum Harmonic Oscillator 61

5.1.1 Low temperature limit 64

5.1.2 High temperature limit 65

5.2 The Polyatomic Ideal Gas 66

5.3 Bosons and Fermions in a Two-Level System 68

5.3.1 The particles are bosons 69

5.3.2 The particles are fermions 72

5.3.3 Classical particles 73

5.4 The Magnetic Chain 75

II. Applications 79

6. The Gas of Photons: The Black Body Radiation 81

6.1 The Energy and the Energy Spectrum 83

6.2 The Free Energy and the Entropy 87

6.2.1 The relation with the wave picture 88

6.3 Light Emission and Absorption of Solids;
Kirchhoff's Law 88

6.4 The Black Body Emission 90

6.5 The Properties of Photon Gas are Independent
of the Shape and the Material of the Cavity 90

7. Atomic Vibration in Solids: Phonons 92

7.1 Atomic Vibration in Solids 92

7.2 The Properties of Phonons 97

7.3 The Low Temperature Case 97

7.4 The High Temperature Case 99

7.5 The Debye Formula 100

7.6 Resolution of the Differential Equation (7.1) by
Means of Trigonometric Functions 104

7.7 Derivation of the Expression (7.30) Giving C_V in the
Debye Model 105

8. The Boson Gas at Low Temperature:	
The Bose–Einstein Condensation	107
8.1 The Chemical Potential	108
8.2 The Energy, Specific Heat, Free Energy and Entropy	112
8.3 Experimental Verification	114
9. The Gas of Fermions: Electrons in Metals and in Semiconductors	116
9.1 Free Electrons in a Box	116
9.1.1 The Fermi–Dirac function	116
9.1.2 The chemical potential or the Fermi level	120
9.1.3 The energy	123
9.1.4 The specific heat	127
9.1.5 Applications to metals	129
9.2 Electrons in Semiconductors	131
10. A History of Statistical Mechanics	136
10.1 Thermodynamics and Statistical Mechanics Before Maxwell and Boltzmann	136
10.2 The Kinetic Theory of Maxwell	138
10.3 Boltzmann and Irreversibility	139
10.4 Gibbs, the Father of Statistical Mechanics	141
10.5 Planck and Einstein: Quantum Theory and Statistics	142
10.6 The Method of Bose and the Bose–Einstein Condensation	145
10.7 The Principle of Pauli and the Statistics of Fermi and Dirac	146
10.8 Modern Developments	147
Exercises	148
Index	161
