

## CONTENTS

<i>Preface</i>	xiii
<b>Chapter 1. SEI on lithium, graphite, disordered carbons and tin-based alloys</b>	<b>1</b>
<i>Emanuel Peled and Diana Golodnitsky</i>	
1. Introduction	1
2. SEI formation	3
2.1 The main principles and routes of the SEI formation	3
2.2 Structure of the SEI	5
3. Chemical composition and properties of the SEI on inert substrate and on lithium	7
3.1 Inert metal substrate	7
3.2 Lithium covered by a native film	10
3.3 SEI formation in solid polymer and gel electrolytes	11
4. Carbonaceous electrodes	13
4.1 Principles of SEI formation	13
4.2 SEI composition and morphology	16
4.2.1 HOPG	16
4.2.2 SLX20	28
4.2.3 Disordered carbons	32
4.2.4 Overview of SEI composition and properties in different carbon/non-aqueous electrolyte systems	45
4.2.5 Effect of carbon modification on SEI formation	49
5. SEI formation on lithium-tin alloys	53
6. Conclusions	59
<b>Chapter 2. Identification of surface films on electrodes in non-aqueous electrolyte solutions: spectroscopic, electronic and morphological studies</b>	<b>70</b>
<i>Doron Aurbach and Yaron S. Cohen</i>	
1. Introduction	70
1a. Passivation of surface films: a general phenomenon	70

1b.	Modes of growth of surface film phenomena, and their transport properties	72
1c.	On the effect of the electrolyte solutions	73
1d.	The role of the cation in surface phenomena in non-aqueous electrolyte solutions	74
1e.	On the impact of the electrode's material	75
1f.	Some comments on applications	76
2.	Methods for identification of surface films on electrodes	77
2a.	Introductory remarks	77
2b.	Fast Fourier Transform Infrared Spectroscopy (FTIR)	78
2c.	Raman spectroscopy	80
2d.	Ultraviolet, Visible Light (UV-Vis)	81
2e.	Extended X-ray Absorption Fine Structure (EXAFS), X-ray Absorption Near-Edge Structure (XANES)	82
2f.	X-ray Photoelectron Spectroscopy (XPS) and Auger (AES) Electron Spectroscopy	82
2g.	Energy Dispersive Analysis of X-rays (EDAX)	82
2h.	Secondary Ion Mass Spectrometry (SIMS)	83
2i.	Electrochemical Quartz Crystal Microbalance (EQCM)	83
2j.	X-ray Diffractometry (XRD)	85
2k.	NMR, ESR spectroscopy	86
2l.	Scanning Probe Microscopies (AFM, STM)	86
2m.	The use of UHV systems for identification of surface films formed on lithium	87
3.	The general structure of surface films on reactive surfaces	87
3a.	Introduction	87
3b.	Surface film formation on active metals	88
3c.	Surface film formation on non-reactive metal and carbon electrodes	90
3d.	On transport properties of surface films	93
4.	Impedance spectroscopy of electrodes covered by surface films	93
4a.	Introductory remarks	93
4b.	Active metal electrodes	94
	4b.1 Lithium	94
	4b.2 Mg electrodes	95
4c.	Non-active metal electrodes polarized to low potentials	97
5.	Identification of surface films formed on lithium and non-active electrodes polarized to low potentials in Li salt solutions	100

5a.	The preparation of a library of FTIR spectra	100
5b.	Identification of surface films formed on Li electrodes in ether solutions	102
5c.	Identification of surface films formed on Li and non-active electrodes at low potentials in ester solutions	105
5d.	Identification of surface films formed on Li and non-active metals at low potentials in alkyl carbonate solutions	107
5e.	The impact of salt anions and contaminant reactions on the surface chemistry of lithium and noble metal electrodes in non-aqueous Li salt solutions	111
5f.	On surface films formed on Li electrodes in polymeric electrolytes	116
6.	Surface films on lithiated carbon electrodes	116
6a.	Introductory remarks: surface film formation on carbon electrodes, the influence of the type of carbon, and the impact of the surface films on Li insertion processes	116
6b.	On the identification of surface films formed on lithiated graphite electrodes	117
6c.	On the correlation between the performance of lithiated graphite anodes and their surface chemistry	120
7.	Surface studies of lithium and lithiated carbon electrodes by scanning probe microscopy	124
7a.	Imaging of Li electrodes by AFM	124
7b.	Graphite electrodes	126
8.	About surface film formation on transition metal oxide cathodes in non-aqueous salt solutions	128
9.	Identification of surface films on calcium and magnesium electrodes	129
10.	Concluding remarks	131
 <b>Chapter 3. Spectroscopy studies of solid-electrolyte interphase on positive and negative electrodes for lithium ion batteries</b>		<b>140</b>
<i>Zhaoxiang Wang, Xuejie Huang and Liqun Chen</i>		
1.	Introduction	140
2.	SEI on tin oxide anode in various electrolytes	141
2.1	Sample preparation and instrumental	143
2.2	Capacity loss and electrolyte decomposition in first cycle	144

2.3	HRTEM study of SEI structure on nano-SnO surface	145
2.4	Identification of $\text{Li}_2\text{CO}_3$ and $\text{ROCO}_2\text{Li}$ on nano-SnO anodes	146
2.5	Formation of $\text{Li}_2\text{CO}_3$ and $\text{ROCO}_2\text{Li}$ on nano-SnO anodes	150
2.6	Question: What is the reduction sequence of SnO and electrolyte?	152
2.7	Electrolyte-dependent SEI composition	154
2.8	Conclusion	157
3.	Surface enhanced Raman scattering (SERS) on rough electrodes	157
3.1	Normal Raman scattering and SERS studies on battery materials	158
3.2	Experimental	159
3.3	Electrochemical performance of Ag electrode	160
3.4	SERS study of passivating film on Ag electrode in lithium batteries	160
3.5	Prospects and conclusions on Raman scattering in SEI investigation	166
4.	Infrared absorption and X-ray photoelectron spectroscopic investigation on performance improvement of surface-modified $\text{LiCoO}_2$ cathode materials	167
4.1	Sample preparation	170
4.2	Comparison of EC adsorbed on different substrates	172
4.3	IR spectra of EC on electrodes charged to different voltages	180
4.4	XPS study on evolution of electronic structure of cathode materials with charge voltages	185
4.5	Conclusions	189
5.	Summary and comments	190
6.	Acknowledgements	190

#### **Chapter 4. Scanning probe microscopy analysis of the SEI formation on graphite anodes** **198**

*Minoru Inaba and Zempachi Ogumi*

1.	Introduction	198
2.	Charge and discharge characteristics of graphite anode in EC- and PC-based solutions	201
3.	Morphology changes of HOPG basal planes in the initial stage of solvent decomposition	203
4.	SEI formation in EC-based solutions	206

5. Effect of co-solvent on solvent co-intercalation in EC-based solutions	211
6. Additives in PC-based solutions	214
6.1 Roles of VC, FEC, and ES as additives	216
6.2 Roles of other additives in PC-based solutions	220
7. Summary and outlook	221
<b>Chapter 5. Theoretical insights into the SEI composition and formation mechanism: density functional theory studies</b>	<b>227</b>
<i>Yixuan Wang and Perla B. Balbuena</i>	
1. Introduction	227
2. Theoretical models and computational details	229
3. Initial reduction of Li <sup>+</sup> (EC), Li <sup>+</sup> (PC), and Li <sup>+</sup> (VC)	231
4. Comparison of reductive decomposition between EC and PC: Li <sup>+</sup> (EC) <sub>n</sub> and Li <sup>+</sup> (PC) <sub>n</sub> (n = 2, 3)	232
4.1 Reduction potentials and ring opening barriers of EC and PC	233
4.2 Decomposition products of EC and PC: Li <sup>+</sup> (EC) <sub>2</sub> and Li <sup>+</sup> (PC) <sub>2</sub>	235
The effect of VC on the reductive decomposition of EC and	
5. PC: (S) <sub>n</sub> Li <sup>+</sup> (VC) (S = EC and PC; n = 1 and 2) clusters	238
5.1 Initial reduction	238
5.2 Termination reaction of radical anions	241
5.3 Summary of reductive decomposition of solvents in the presence of VC	246
6. Associations of lithium alkyl dicarbonates through O <sup>-</sup> •••Li <sup>+</sup> •••O <sup>-</sup> bridges	247
6.1 Geometries and energetics	247
6.2 Vibrational frequencies	255
7. Adsorption and two-dimensional association of lithium alkyl dicarbonates on graphite surfaces through O <sup>-</sup> •••Li <sup>+</sup> •••π (arene) interactions	260
7.1 H-truncated cluster models	261
7.2 Adsorption of lithium alkyl dicarbonates on the basal plane of the neutral graphite surface	262
7.3 Adsorption of lithium alkyl dicarbonates on the basal plane of negatively charged Gr <sub>54</sub> <sup>-</sup> and edge plane of Gr <sub>78</sub> <sup>-</sup>	267

7.4	Two-dimensional association of lithium alkyl dicarbonates on the basal plane of the graphite surface (Gr <sub>96</sub> )	269
7.5	Summary about adsorptions of LVD, LED and LPD on anode surface	271
8.	Remarks on the failure of PC and the efficiency of VC for the SEI layer formation in EC/PC-based solutions	272
<b>Chapter 6. Continuum and statistical mechanics-based models for solid-electrolyte interphases in lithium-ion batteries</b>		<b>276</b>
<i>Harry J. Ploehn, Premanand Ramadass, Ralph E. White, Diego Altomare and Perla B. Balbuena</i>		
1.	Introduction	276
2.	Continuum models for SEI growth	277
2.1	Overview of previous macroscopic models	277
2.2	Elements of continuum mechanics	280
2.2.1	Kinematics	282
2.2.2	Conservation of mass	285
2.3	Dynamic continuum models for SEI formation and growth	287
2.3.1	Growth limited by SEI electronic conductivity	288
2.3.2	Growth limited by solvent diffusion	291
3.	Statistical mechanics-based model	296
3.1	Description of the lattice-gas model	297
3.1.1	Implementation of the model	299
3.2	Results and discussions	299
3.3	Remarks with respect to the lattice model	305
<b>Chapter 7. Development of new anodes for rechargeable lithium batteries and their SEI characterization by Raman and NEXAFS spectroscopy</b>		<b>308</b>
<i>Giselle Sandi</i>		
1.	Introduction	308
2.	Carbon as a host in lithium ion cells	310
3.	Alternative anode materials	319
4.	UV Raman spectroscopy of templated-disordered carbons	321
5.	SEI characterization by NEXAFS	323

6. Conclusions	331
7. Acknowledgements	331
<b>Chapter 8. The cathode-electrolyte interface in a Li-ion battery</b>	<b>337</b>
<i>Kristina Edström, Torbjörn Gustafsson and Josh Thomas</i>	
1. Background	337
2. $\text{LiMn}_2\text{O}_4$	338
2.1 XPS analysis	340
2.2 Elevated temperature effects for $\text{LiMn}_2\text{O}_4$	344
3. $\text{LiCoO}_2$ , $\text{LiNiO}_2$ and $\text{LiNi}_{0.8}\text{Co}_{0.2}\text{O}_2$	353
4. $\text{LiFePO}_4$	358
5. Summary	360
<b>Chapter 9. Theoretical studies on the solvent structure and association properties, and on the Li-ion solvation: implications for SEI layer phenomena</b>	<b>365</b>
<i>Yixuan Wang and Perla B. Balbuena</i>	
1. Introduction	365
2. Computational details	367
3. Geometric structures of various cyclic/linear carbonates, and effective additives and co-solvents to PC-based solutions	368
4. Self and cross associations of cyclic/linear carbonates via C-H...O interactions	373
4.1 Geometric and energetic properties	374
4.2 C-H bond lengths and vibrational frequencies	380
4.3 C=O bond lengths and vibrational frequencies	384
4.4 Characteristics of C-H...O interactions using AIM	384
5. $\text{Li}^+$ solvation from alkyl carbonates	387
5.1 Interactions between $\text{Li}^+$ and organic solvents	387
5.2 Solvation number of $\text{Li}^+$	390
6. Conclusion: Implications for SEI layer phenomena	393
<i>Index</i>	398
