

## CONTENTS

Preface	vii
<b>GROWTH AND FORM</b>	<b>1</b>
<b>Paradigms of Pattern Formation: Towards a Computational Theory of Morphogenesis</b>	<b>3</b>
<i>Przemyslaw Prusinkiewicz</i>	3
1 Introduction	3
2 Single blind agent with finite memory	6
3 Single blind agent with infinite memory	7
4 Single sighted agent receiving cues from the environment (one-way exogenous control)	8
5 Single sighted agent receiving cues from the structure (two-way exogenous control)	10
6 Single self-controlled agent (endogenous control)	11
7 Multiple blind agents with finite memory	12
8 Multiple blind agents with infinite memory	14
9 Multiple sighted agents	14
10 Multiple endogenously-controlled agents	16
11 Combined effect of multiple mechanisms	18
12 Conclusions	19
<b>Growth and Form of Sponges and Corals in a Moving Fluid</b>	<b>24</b>
<i>Jaap A. Kaandorp and Peter M. A. Sloot</i>	24
1 Introduction	24
1.1 Biological background	24
1.2 Simulation of growth in a mono directional flow	26
1.3 Simulation of growth in a bidirectional (alternating) flow	28
2 Methods	29
2.1 Modelling the nutrient distribution	29
2.2 Modelling the growth process in an alternating flow	31
3 Results	32
4 Discussion	37
<b>From Pseudo-Random Numbers to Stochastic Growth Models and Texture Images</b>	<b>42</b>
<i>Leonid P. Yaroslavsky</i>	42
1 Introduction	42
2 Pseudo-random number generators	43
3 Growth models	45
3.1 Eden's type growth models	45
3.2 Conway's "Game of Life" and its modifications	48
4 Algorithmic models of texture images	54
4.1 The algorithmic approach to synthesis and analysis of texture images	55

<b>Crystal Growth, Biological Cell Growth, and Geometry</b>	<b>65</b>
<i>James W. Cannon, William J. Floyd and Walter R. Parry</i>	65
1 Introduction	65
2 A growing tree trunk whose shape oscillates wildly in time	66
2.1 Cell growth versus crystal growth	66
2.2 The groundrules	66
2.3 The plan	67
2.4 The coordination problem	68
2.5 The signal problem	68
2.6 The delay problem	69
2.7 The signal cascade	70
2.8 Using boundaries	70
2.9 Measuring shape	70
2.10 The example	71
3 The geometry of rat tissue	72
3.1 Discrete geometry	72
3.2 Euclidean geometry, the lens of the eye, and muscle fibers	73
3.3 Spherical geometry and the bladder	73
3.4 Negatively curved geometry and the lung, brain, digestive, and endocrine systems	73
3.5 Conflicting geometries	74
4 Crystals	75
4.1 Examples of crystals	75
4.2 Ways of viewing crystals	76
5 Negatively curved crystals are asymptotically fractal	78
5.1 The Cayley crystal	78
5.2 Thin triangles	79
5.3 Asymptotic shape	79
5.4 Fractal Theorem	80
5.5 Proof	80
<b>Recent Results on Aperiodic Wang Tilings</b>	<b>83</b>
<i>Jarkko Kari</i>	83
1 Introduction	83
2 Algebraic construction of aperiodic tile sets	87
3 Forced tiles and determinism	89
4 Beyond aperiodicity	93
5 Conclusions and open problems	94
<b>REACTION-DIFFUSION AND BEYOND</b>	<b>97</b>
<b>Biological Pattern Formation as a Complex Dynamic Phenomenon</b>	<b>99</b>
<i>Hans Meinhardt</i>	99
1 The problem of pattern formation	99
1.1 The egg cannot contain the final pattern	100

1.2	Organizing regions	100
1.3	The concept of positional information	101
2	Generation of a primary pattern by autocatalysis and lateral inhibition	101
2.1	The Activator-Inhibitor concept	102
2.2	Comparison with Turing's mechanism	105
3	The wave length problem — stabilization of a monotonic gradient by a feedback on the source density	106
3.1	How to generate structures close to each other, how at a distance: head, foot and tentacle formation in <i>Hydra</i>	108
4	Activation of genes under the influence of morphogenetic signalling	110
5	Formation of filament-like branching structures	113
6	Segmentation by mutual activation of cell states that locally exclude each other	115
7	Pattern formation in secondary embryonic fields: differentiation borders obtain organizing properties	116
8	Pigmentation pattern of shells of mollusk — a natural picture book to study dynamic systems	117
8.1	Traces of a stable pattern, oscillations and travelling waves: lines parallel, perpendicular or oblique to the direction of growth	118
9	Travelling waves with unusual properties	119
9.1	Formation of branches: the sudden formation of backwards-running waves	119
9.2	Penetration of waves without annihilation	121
9.3	Not all together now	123
9.4	Travelling waves without pace-maker	124
10	Complex patterns result from the superposition of two patterns	124
10.1	Superposition of two time-dependent patterns	126
10.2	Open problems in shell patterning	127
<b>Andronov Bifurcations and Sea Shell Patterns</b>		<b>133</b>
<i>M. Argentina and P. Couillet</i>		133
1	Andronov bifurcations in extended systems	136
2	Sea shell patterns	139
2.1	Cavitation like patterns	141
2.2	Patterns of excitable waves	141
<b>Rational and Irrational Angles in Phyllotaxis</b>		<b>145</b>
<i>Y. Couder and S. Douady</i>		145
1	Introduction	145
1.1	The geometry of phyllotaxis	145
1.2	The dynamics of phyllotaxis	146
2	The self organisation in model iterative systems	147
2.1	Hofmeister's rules: the spiral modes	147
2.2	The dynamical selection of the Fibonacci modes	148
2.3	The generalised model: Snow and Snow's rules	153
2.4	The selection of the actually observed patterns	155

3	The selection during the plant growth	156
4	Conclusions	156
<b>CELLULAR PATTERNS</b>		<b>161</b>
<b>Organogenetic Cellular Patterning in Plants</b>		<b>163</b>
	<i>P. W. Barlow, H. B. Lück and J. Lück</i>	163
1	Introduction	163
2	Cell patterning from the perspective of the cell body	164
3	What lies behind analyses of cell patterning?	167
4	A simple autoregenerating cell pattern related to organogenesis	169
5	Simulation of cell patterns and the uncovering of division rules	172
5.1	The Simulation System for the <i>Psilotum</i> Apex	172
5.2	Identification of cell types	177
5.3	Merophyte formation by apical divisions	178
5.4	Wall-offsetting leads to refinement of the wall production system	179
5.5	The distribution of apical triangular cells and the problem of dichotomous axis branching	181
6	Possible regulatory factors underlying cell patterning and its simulation at the <i>psilotum</i> apex	182
6.1	A System's View of Division Wall Site Selection	182
6.2	Cytological View of Division Wall Site Selection	186
7	Was there a precursor of the <i>psilotum</i> pattern?	189
8	Prospects	193
<b>A Classification of Plant Meristems based on Cellworks (3D L-systems). The Maintenance and Complexity of Their Cellular Patterns</b>		<b>199</b>
	<i>Jacqueline Lück and Hermann B. Lück</i>	199
1	Introduction	199
2	Cellworks	201
3	A classification of plant forms	203
4	Specification of a cellwork system with double labelled walls	208
5	How to find a Cellwork system with an autoreproductive initial cell	209
6	Extended classification of plant forms	210
7	Passage from one generating system to another	212
8	Limits of the classification tables	212
9	From topology to geometry	212
10	Conclusion	214
<b>Plant Meristems and Their Patterns</b>		<b>217</b>
	<i>Beata Zagórska-Marek</i>	217
1	Introduction	217
2	Patterns of the shoot apical meristem	218
2.1	Developmental variation of cellular patterns	218
2.2	The geometry of a growing apex	222

2.3 Phyllotaxis	224
3 Cellular patterns of vascular cambium	228
3.1 Storied pattern	229
3.2 The pattern of growth activity	231
3.3 Structural wavy patterns	232
4 Conclusions	235
<b>Mechanical Stress Patterns in Plant Cell Walls and Their Morphogenetical Importance</b>	<b>240</b>
<i>Zygmunt Hejnowicz</i>	240
1 Introduction	240
2 Stress anisotropy	240
3 Stress distribution	245
4 Conclusions	248
<b>Tensorial Model for Growth and Cell Division in the Shoot Apex</b>	<b>252</b>
<i>Jerzy Nakielski</i>	252
1 Symplastic Growth and the Growth Tensor	252
2 Model for Growth and Cell Division in the Shoot Apex (2-dimensional)	254
3 The Example of Application of the Model	259
4 Discussion	263
<b>DNA AND GENETIC CONTROL</b>	<b>269</b>
<b>DNA Nanotechnology: From Topological Control to Structural Control</b>	<b>271</b>
<i>Nadrian C. Seeman</i>	271
1 DNA Nanotechnology	271
2 Double Helical DNA	272
3 Genetic Recombination and the Holliday Junction	274
4 Immobile Branched Junctions	275
5 Characterization of Unusual DNA Motifs and Structures	277
6 DNA Ligation and Cohesion	278
7 Branched DNA and Sticky Ends	280
8 Connectivity	281
9 Topological Features of DNA Constructs	281
10 Construction of DNA Polyhedra	282
11 DNA Catenanes and Knots	286
12 Construction of DNA Knots	288
13 DNA Borromean Rings	289
14 Rigid Components	292
15 1-D and 2-D Periodic Arrays	294
16 Nanomechanical Devices	297
17 Prospects	300

<b>3D DNA Patterns and Computation</b>	<b>310</b>
<i>Nataša Jonoska</i>	310
1 Introduction	310
2 Constructing Graphs with $k$ -Armed Branched Molecules	312
2.1 The Hamiltonian cycle problem	312
3 The Three Vertex Colorability Problem (3VC)	315
4 Recognition of Graph Structures	318
4.1 Covering graphs and complexity	318
4.2 Graphs made of one single stranded DNA molecule	319
5 Final Remarks	321
<b>Circular Suggestions for DNA Computing</b>	<b>325</b>
<i>Tom Head</i>	325
1 Introduction	325
2 Naturally Occurring Plasmids	326
3 The Delphic Plasmid, DEL	327
4 Independent Subsets and Vertex Covers for Undirected Graphs	329
5 Partitions into Hamiltonian Subgraphs	331
6 Satisfiability of Boolean Formulas	332
<b>DNA Computing by Matching: Sticker Systems and Watson-Crick Automata</b>	<b>336</b>
<i>Gheorghe Păun</i>	336
1 Introduction	336
2 DNA: Structure and Annealing Operation	339
3 Formal Language Theory Prerequisites	341
4 The Twin-shuffle Language and its Relation with DNA	342
5 The Operation of Sticking	344
6 Sticker Systems	346
7 The Power of Sticker Systems	349
8 Watson-Crick Finite Automata	352
9 The Power of Watson-Crick Finite Automata	353
10 Variants of Watson-Crick Automata	356
11 Conclusions	359
<b>IMAGES AND PERCEPTION</b>	<b>363</b>
<b>Aspects of Human Shape Perception</b>	<b>365</b>
<i>Jacques Ninio</i>	365
1 Shape from motion	365
2 From moving to static shapes	367
3 Static shapes: the gestalt approach	367
4 Static shapes: the importance of orientations	370
5 2D perceptual geometry	373
6 From 2D to 3D	374
7 Shape synthesis	378

<b>Pattern Recognition in The Visual System and The Nature of Neural Coding</b>	<b>382</b>
<i>Simon Thorpe</i>	382
1 Introduction	382
2 The efficiency of pattern recognition by the human visual system	382
3 The Coding Problem	385
4 An alternative — Using patterns of spikes	386
5 Rank Order Coding	387
6 Rank Order Decoding	388
7 Conclusions and Perspectives	390
<b>How can Singularity Theory Help in Image Processing?</b>	<b>392</b>
<i>M. Briskin, Y. Elichai and Y. Yomdin</i>	392
1 Introduction	392
2 Digital images	395
3 Compression problem	396
4 An example of data representation, based on normal forms of singularities	400
5 Singularities of digital images and their normal forms	402
6 Detection of singularities and their approximation by normal forms	408
7 Vectorized images	415
8 Creation of virtual worlds	418
9 Possible implications for human visual perception	423
