

# Contents

<i>Preface</i>	vii
1. Finite differences	1
1.1 Function discretization . . . . .	2
1.2 Finite-difference approximation of derivatives . . . . .	3
1.3 Approximation for higher-order derivatives . . . . .	5
1.4 Finite-difference operators . . . . .	7
2. Fourier model of heat conduction	9
2.1 Fourier model of heat conduction . . . . .	10
2.2 Heat equation . . . . .	10
2.3 Initial and boundary conditions . . . . .	13
2.4 Phase-change problems . . . . .	14
2.5 Heat conduction in a moving medium . . . . .	17
2.6 Fick's law and diffusion . . . . .	17
3. An explicit method for the heat equation	21
3.1 Non-dimensional form of the heat equation . . . . .	22
3.2 The classical explicit method . . . . .	23
3.3 Matrix form . . . . .	24
3.4 Stability . . . . .	25
3.5 Consistency . . . . .	28
3.6 Convergence . . . . .	30
3.7 Neumann boundary conditions . . . . .	31
3.8 Boundary conditions of the third kind . . . . .	33

4.	A Windows program	35
4.1	Introduction . . . . .	36
4.2	Creating a new project . . . . .	37
4.3	Equation data . . . . .	40
4.4	Initial data . . . . .	45
4.5	Boundary data . . . . .	50
4.6	Numerical results . . . . .	55
4.7	Analysis of data . . . . .	59
4.8	Graphical results. Examples . . . . .	60
4.9	Icons . . . . .	66
5.	The Heat2 project	67
5.1	Introduction . . . . .	68
5.2	The project . . . . .	69
5.3	Document class . . . . .	70
5.4	Equation class . . . . .	74
5.5	Initial and boundary data . . . . .	80
5.6	View class . . . . .	83
5.7	Examples . . . . .	91
6.	Parabolic equations	93
6.1	A simple implicit method . . . . .	94
6.2	Crank-Nicolson method . . . . .	97
6.3	Von Neumann stability . . . . .	101
6.4	Combined scheme . . . . .	106
6.5	An example of unstable method . . . . .	107
6.6	DuFort-Frankel method . . . . .	108
6.7	Matrix stability . . . . .	112
6.8	Stability analysis by the energy method . . . . .	116
6.9	Variable diffusivity coefficient . . . . .	121
6.10	Heat equation in two and three space dimensions . . . . .	121
6.11	Diffusion-convection equation . . . . .	123
6.12	Nonlinear equation . . . . .	126
6.13	A free boundary problem . . . . .	128
7.	The Heat3 project	133
7.1	Introduction . . . . .	134
7.2	Main menu . . . . .	137

7.3	Implementing the document class . . . . .	138
7.4	Dialog resources . . . . .	143
7.5	Implementing the view class . . . . .	157
7.6	Using the program . . . . .	171
8.	Wave motions . . . . .	175
8.1	One-dimensional continuum . . . . .	176
8.2	Flexible strings . . . . .	179
8.3	Wave equation . . . . .	179
8.4	Waves in elastic solids . . . . .	182
8.5	Motion of fluids . . . . .	186
8.6	Free piston problem . . . . .	189
9.	Finite-difference methods for the wave equation . . . . .	191
9.1	Courant-Friederichs-Lewy method . . . . .	192
9.2	Implicit methods . . . . .	196
9.3	Perturbed wave equation . . . . .	201
10.	Hyperbolic equations . . . . .	209
10.1	First-order equations. Explicit methods . . . . .	210
10.2	Implicit methods . . . . .	218
10.3	Systems of first-order equations . . . . .	221
10.4	Nonlinear systems . . . . .	226
11.	Elliptic equations . . . . .	229
11.1	Historic model . . . . .	230
11.2	Porous media . . . . .	230
11.3	Dirichlet problem . . . . .	233
11.4	Curved boundary . . . . .	239
11.5	Three-dimensional applications . . . . .	241
11.6	Green's identities. Consequences . . . . .	242
11.7	Neumann problem . . . . .	245
11.8	Third boundary value problem . . . . .	251
Appendix A	Classification of PDEs . . . . .	255
A.1	Second-order partial differential equations . . . . .	256
A.2	Systems of first-order PDEs . . . . .	258

Appendix B	Elements of linear algebra	263
B.1	Eigenvalues and eigenvectors . . . . .	264
B.2	Vector and matrix norms . . . . .	269
