Preface to the First Edition	vii
Preface to the Second Edition	xi
1 The need for measure theory	1
1.1 Various kinds of random variables	1
1.2 The uniform distribution and non-measurable sets	2
1.3 Exercises	4
1.4 Section summary	5
2 Probability triples	7
2.1 Basic definition	7
2.2 Constructing probability triples	8
2.3 The Extension Theorem	10
2.4 Constructing the Uniform[0, 1] distribution	15
2.5 Extensions of the Extension Theorem	18
2.6 Coin tossing and other measures	20
2.7 Exercises	23
2.8 Section summary	27
3 Further probabilistic foundations	29
3.1 Random variables	29
3.2 Independence	31
3.3 Continuity of probabilities	33
3.4 Limit events	34
3.5 Tail fields	36
3.6 Exercises	38
3.7 Section summary	41
4 Expected values	43
4.1 Simple random variables	43
4.2 General non-negative random variables	45
4.3 Arbitrary random variables	49
4.4 The integration connection	50
4.5 Exercises	52
4.6 Section summary	55
5 Inequalities and convergence	57
5.1 Various inequalities	57
5.2 Convergence of random variables	58
5.3 Laws of large numbers	60
5.4 Eliminating the moment conditions	61

5.5	Exercises	65
5.6	Section summary	66
6	Distributions of random variables	67
6.1	Change of variable theorem	67
6.2	Examples of distributions	69
6.3	Exercises	71
6.4	Section summary	72
7	Stochastic processes and gambling games	73
7.1	A first existence theorem	73
7.2	Gambling and gambler's ruin	75
7.3	Gambling policies	77
7.4	Exercises	80
7.5	Section summary	81
8	Discrete Markov chains	83
8.1	A Markov chain existence theorem	85
8.2	Transience, recurrence, and irreducibility	86
8.3	Stationary distributions and convergence	89
8.4	Existence of stationary distributions	94
8.5	Exercises	98
8.6	Section summary	101
9	More probability theorems	103
9.1	Limit theorems	103
9.2	Differentiation of expectation	106
9.3	Moment generating functions and large deviations	107
9.4	Fubini's Theorem and convolution	110
9.5	Exercises	113
9.6	Section summary	115
10	Weak convergence	117
10.1	Equivalences of weak convergence	117
10.2	Connections to other convergence	119
10.3	Exercises	121
10.4	Section summary	122
11	Characteristic functions	125
11.1	The continuity theorem	126
11.2	The Central Limit Theorem	133
11.3	Generalisations of the Central Limit Theorem	135
11.4	Method of moments	137
11.5	Exercises	139

11.6 Section summary	142
12 Decomposition of probability laws	143
12.1 Lebesgue and Hahn decompositions	143
12.2 Decomposition with general measures	147
12.3 Exercises	148
12.4 Section summary	149
13 Conditional probability and expectation	151
13.1 Conditioning on a random variable	151
13.2 Conditioning on a sub- σ -algebra	155
13.3 Conditional variance	157
13.4 Exercises	158
13.5 Section summary	160
14 Martingales	161
14.1 Stopping times	162
14.2 Martingale convergence	168
14.3 Maximal inequality	171
14.4 Exercises	173
14.5 Section summary	176
15 General stochastic processes	177
15.1 Kolmogorov Existence Theorem	177
15.2 Markov chains on general state spaces	179
15.3 Continuous-time Markov processes	182
15.4 Brownian motion as a limit	186
15.5 Existence of Brownian motion	188
15.6 Diffusions and stochastic integrals	190
15.7 Itô's Lemma	193
15.8 The Black-Scholes equation	194
15.9 Section summary	197
A Mathematical Background	199
A.1 Sets and functions	199
A.2 Countable sets	200
A.3 Epsilons and Limits	202
A.4 Infimums and supremums	204
A.5 Equivalence relations	207

B Bibliography	209
B.1 Background in real analysis	209
B.2 Undergraduate-level probability	209
B.3 Graduate-level probability	210
B.4 Pure measure theory	210
B.5 Stochastic processes	210
B.6 Mathematical finance	211
Index	213
