Preface	v
Introduction	1
1 Preliminaries and Basic Definitions in Network Theory	5
1.1 Introduction	5
1.2 Basic definitions	5
1.3 Different kinds of graphs	7
1.3.1 Weighted, directed and oriented graphs	7
1.3.2 Subgraphs	8
1.3.3 Partited graphs	9
1.4 Paths and cycles	9
1.4.1 Trees	10
1.5 Statistics on graphs	11
1.5.1 Small world properties	11
1.5.2 Clustering coefficient	12
1.5.3 Degree distribution	12
1.6 Complexity	14
1.7 What is next	15
2 Models of Complex Networks	17
2.1 Introduction	17
2.2 Random networks	18
2.2.1 Erdős-Rényi networks	18
2.2.2 Fitness networks	21
2.3 Preferential attachment networks	23
2.3.1 The Barabási-Albert model	25
2.3.2 Duplication-divergence models	27
2.3.3 Growing weighted networks	30
2.4 The small-world model	32
2.5 Outlook	33
3 Correlations in Complex Networks	35

3.1	Introduction	35
3.2	Detailed balance condition	36
3.3	Empirical measurement of correlations	39
3.3.1	Two vertices correlations: ANND	41
3.3.2	Three vertices correlations: Clustering	45
3.4	Networks in the real world	47
3.4.1	Pretty-good-privacy web of trust	51
3.5	Modeling correlations	54
3.5.1	Disassortative correlations	55
3.5.2	The configuration model	55
3.5.3	Growing models	56
3.5.4	Assortativity generators	57
3.5.5	Modeling clustered networks	59
3.5.6	Random graphs with attributes	60
3.5.7	Hidden color models	61
3.5.8	Fitness or hidden variables models	62
3.5.9	Fitness and preferential attachment models	64
3.6	Outlook	65
4	The Architecture of Complex Weighted Networks: Measurements and Models	67
4.1	Introduction	67
4.2	Tools for the characterization of weighted networks	68
4.2.1	Weights	68
4.2.2	Degree and weight distributions	68
4.2.3	Weighted degree: Strength	68
4.2.4	Weighted clustering	69
4.2.5	Weighted assortativity: Affinity	70
4.2.6	Local heterogeneity	71
4.3	Weighted networks: Empirical results	72
4.3.1	Transportation networks	73
4.3.2	Airport network	73
4.3.3	Urban and inter-urban movement networks	77
4.3.4	Transportation networks: Summary	78
4.3.5	Social network: Example of the scientific collabora- tion network	79
4.3.6	Biological network: The case of the metabolic network	83
4.4	Modeling weighted networks	83
4.4.1	Coupling weight and topology	83

4.4.2	A simple model: Weight perturbation and “busy get busier” effects	84
4.4.3	Local heterogeneities, nonlinearities and space-topology coupling	88
4.4.4	Other models coupling traffic and topology	90
4.5	Outlook	91
5	Community Structure Identification	93
5.1	Introduction	93
5.2	Definitions of communities	94
5.3	Evaluating community identification	96
5.4	Link removal methods	97
5.4.1	Shortest path centrality	97
5.5	Current-flow and random walk centrality	98
5.5.1	Information centrality	99
5.5.2	Link clustering	100
5.6	Agglomerative methods	100
5.6.1	Hierarchical clustering	100
5.6.2	L-shell method	101
5.7	Methods based on maximising modularity	102
5.7.1	Greedy algorithm	102
5.7.2	Simulated annealing methods	102
5.7.3	Extremal optimisation	103
5.8	Spectral analysis methods	104
5.8.1	Spectral bisection	104
5.8.2	Multi dimensional spectral analysis	105
5.8.3	Constrained optimisation	106
5.8.4	Approximate resistance networks	106
5.9	Other methods	107
5.9.1	Clustering and curvature	107
5.9.2	Random walk based methods	108
5.9.3	Q-potts model	110
5.10	Comparative evaluation	111
5.11	Conclusion	113
6	Visualizing Large Complex Networks	115
6.1	Introduction	115
6.2	Global methods for visualizing large graphs	116
6.2.1	Spring embedder based methods	117
6.2.2	Properties	118
6.2.3	Spectral layout	121

6.2.4	Properties	122
6.3	Analytical layouts	124
6.3.1	Centrality and status layouts	125
6.3.2	Clustered layouts	126
6.3.3	Case studies	129
7	Modeling the Webgraph: How Far We Are	133
7.1	Introduction	133
7.2	Preliminaries	134
7.3	WebBase	137
7.3.1	In-degree and out-degree	138
7.3.2	PageRank	140
7.3.3	Bipartite cliques	141
7.3.4	Strongly connected components	142
7.4	Stochastic models of the webgraph	142
7.4.1	Models of the webgraph	143
7.4.2	A multi-layer model	144
7.4.3	Large scale simulation	146
7.5	Algorithmic techniques for generating and measuring webgraphs	149
7.5.1	Data representation and multifiles	151
7.5.2	Generating webgraphs	152
7.5.3	Traversal with two bits for each node	154
7.5.4	Semi-external breadth first search	154
7.5.5	Semi-external depth first search	155
7.5.6	Computation of the SCCs	155
7.5.7	Computation of the bow-tie regions	156
7.5.8	Disjoint bipartite cliques	157
7.5.9	PageRank	160
7.6	Summary and outlook	161
8	The Large Scale Structure of the Internet	162
8.1	Introduction	163
8.2	Internet maps	164
8.3	Heavy tailed distributions	168
8.4	Sampling biases and the scale-free nature of the Internet	171
8.5	Hierarchies and correlations	173
8.6	Outlook	183
9	Spanning Trees in Ecology	185
9.1	Introduction	185
9.2	Graph-theoretical formalism	186

9.2.1	Basic notions	187
9.2.2	Connected subgraphs and minimum spanning trees	188
9.3	Graphs and spanning trees in ecology	189
9.3.1	Spanning trees in food webs	189
9.3.2	Spanning trees in taxonomy	192
9.4	Empirical results	195
9.4.1	Food webs	195
9.4.2	Taxonomic trees	198
9.5	Summary and outlook	202
10	Social and Financial Networks	205
10.1	Introduction	205
10.2	Social networks: Examples and general features	206
10.3	Degree distribution	208
10.3.1	Open questions on degree distribution	210
10.4	Assortativity	210
10.4.1	Open questions on assortativity	212
10.5	Clustering	213
10.5.1	Open questions on clustering	214
10.6	Community structure	214
10.6.1	Open questions on community structure	216
10.7	Economical networks: The case-study of the board of directors	218
10.7.1	Board and directors network as bipartite graphs	220
10.8	Topological properties of boards and directors Networks	222
10.8.1	Average quantities	222
10.8.2	Degree distributions and assortativity	224
10.8.3	Lobbies	226
10.9	Modeling boards of directors networks	228
10.9.1	Interlock structure and decision making dynamics	228
10.9.2	Single board decision making model	229
10.9.3	Multiple boards decision making model	232
10.10	Conclusion	233
	References	235
	Index	249
