<i>Preface</i>	vii
1. Introduction	1
2. Self-Similarity	7
2.1 Self-Similarity in Lattices and Networks	7
2.1.1 The concept of self-similarity: a few examples	7
2.1.2 Self-similarity and scale	10
2.2 Mathematical Description of Self-Similar Growth	13
2.3 One-Sided Growth by Agglomeration	19
2.3.1 Probabilistic description of agglomeration process	19
2.3.2 Energy barriers and Boltzmann factors	23
3. Topological and Statistical Properties of Networks	29
3.1 General Considerations	29
3.2 Topology and Geometry of Tilings and Networks	30
3.3 Statistical Properties of Networks, Configurational Entropy and Local Order	42
3.4 Topological Defects and Curvature	46
4. Bonds and Interactions in Networks	51
4.1 Preamble: A Historical Reminder	51
4.2 Properties of Chemical Bonds	53
4.2.1 Generalities	53
4.2.2 The four types of bonds	54
4.3 Dendritic and Ring-Forming Tendencies in Covalent Networks	59

4.4	A Lagrangean Approach to Network Interactions	63
4.4.1	A model in two dimensions	64
4.4.2	Generalization to three dimensions	75
5.	Stochastic Agglomeration Model	85
5.1	General Considerations	85
5.2	A Two-Component Model in One Dimension	86
5.3	Dendritic Agglomeration of Star-Like Entities	90
5.4	Agglomeration of Rings in Two Dimensions	94
5.4.1	Second agglomeration step: chains and cells	102
5.5	Markov Chains and Random Walks	110
5.5.1	Basic definitions	110
5.5.2	Detailed balancing	112
5.6	The Stochastic Matrix Method	113
5.6.1	Bond saturation	114
5.6.2	Rim saturation	119
6.	Model of Quasi-Crystalline Growth	121
6.1	Preamble: Aperiodic Structures and Quasicrystals	121
6.1.1	The discovery of quasicrystals	121
6.1.2	A few generalities on aperiodic structures	123
6.2	Mathematical Properties of Penrose Tilings	126
6.3	Agglomeration Model for a 2-dimensional Quasicrystal	131
6.3.1	The first agglomeration step: creating the doublets	133
6.3.2	The second step: creating chains and cells	136
6.4	Other Models of Quasi-Crystalline growth	142
7.	Nucleation and Growth of Fullerenes	149
7.1	Preamble: A Short History of Fullerenes' Discovery	149
7.1.1	Other carbon nanostructures	151
7.2	Dynamical Model of Fullerene Growth	153
7.2.1	Statistical model based on self-similarity	153
7.2.2	Kinetic and energetic considerations	161
7.3	Geometry of Onion Fullerenes	163
8.	Icosahedral Virus Capsid Growth	169
8.1	Preamble: Capsid Viruses	169
8.2	Probabilistic Analysis of Capsid Agglomeration	172

8.3	Combinatorics of Icosahedral Capsid Growth	176
8.3.1	Regular capsids	176
8.3.2	Agglomeration rules for the MS2 phage	185
8.3.3	Hindering capsid agglomeration	189
9.	Glasses and their Properties	191
9.1	Preamble: A Concise History of Glass Making	191
9.2	Definition and Classification of Glasses	195
9.3	Glass Transition and its Characteristic Features	201
9.4	The Entropy in Glasses	204
9.4.1	Residual entropy and Kauzmann's paradox	204
9.4.2	Entropy and Viscosity	210
9.4.2.1	Microscopic model of viscosity	210
9.4.2.2	Viscosity and configurational entropy	213
10.	Kinetics of Crystallization in Liquids	217
10.1	Agglomeration Velocity	217
10.1.1	Nucleation velocity	218
10.1.2	Kinetic factors	220
10.2	Crystallization Velocity	225
10.3	The Kolmogorov-Avrami Equation and the TTT Diagram	230
10.4	Immiscibility. Spinodal and Binodal Curves.	233
11.	Stochastic Agglomeration Model of Glass Transition	239
11.1	General Setting	239
11.1.1	Preliminary considerations	239
11.1.2	The phase space landscape	242
11.2	A Simple Model: Agglomeration of Covalent Atoms	244
11.2.1	Evolution of probabilities during agglomeration	244
11.2.2	Physical interpretation	248
11.3	Stochastic Matrix Model of Glass Transition	257
11.3.1	Structural model of pure B_2O_3 glass	265
11.3.2	A random walk model of pure B_2O_3 glass	273
12.	Ternary and Multicomponent Glasses. Immiscibility	277
12.1	Ternary Glass Model	277
12.1.1	Low modifier concentration	277
12.1.2	General case: inclusion of $B - B$ and $C - C$ links	283

12.1.3	Comparison with experimental data	285
12.2	The Finite Volume Effect and Immiscibility	286
12.2.1	The fixed point and its stability	291
12.2.2	Immiscibility dome of the $(SiO)_{1-x}(Na_2O)_x$ glass	293
13.	Glass Transition and the Cooling Rate	297
13.1	Models of Rapid Cooling	297
13.1.1	Critical cooling rate from crystallization kinetics	298
13.1.2	Structural relaxation model	299
13.1.3	Time-dependent stochastic agglomeration	303
13.2	Rapid Cooling within the Stochastic Matrix Model	310
14.	Rigidity, Connectivity and Homogeneity in Glasses	315
14.1	General Principles	315
14.2	Rigidity, Vibrational Modes and Thermodynamics	319
14.3	Connectivity, rigidity and local structure in glasses	323
14.3.1	Connectivity in pure dendritic networks	323
14.3.2	Connectivity conservation in alkali-borate glasses	325
14.4	Self-Organization in Glasses	329
14.4.1	The intermediary isostatic phase	329
14.4.2	Stochastic versus correlated regimes	331
14.5	The Composition of Window Glass	333
Appendix A	Mathematical Complement	341
A.1	Stochastic matrices and their properties	341
A.1.1	General properties	341
A.1.2	Projectors and asymptotics	344
A.1.3	Asymptotic form of M^∞	346
A.2	Non-linear Differential Equations	347
<i>Bibliography</i>		353
